

TEST RESULT SUMMARY

FCC PART 24 SUBPART E

MANUFACTURER'S NAME	ADC Telecommunications
NAME OF EQUIPMENT	Digivance In-Building Coverage Solution (Wireless Communication System)
MODEL NUMBER	DGVI-312110 DHU DGVI-313110 DRU
MANUFACTURER'S ADDRESS	PO Box 1101 Minneapolis MN 55440
TEST REPORT NUMBER	NC103808
TEST DATE	30 April, 08 May, 14 June 2001

According to testing performed at TÜV Product Service Inc, the above-mentioned unit is in compliance with the electromagnetic compatibility requirements defined in FCC Part 24 Subpart E.

It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical characteristics. Any modifications necessary for compliance made during testing on the above mentioned date(s) must be implemented in all production units for compliance to be maintained.

TÜV Product Service Inc, as an independent testing laboratory, declares that the equipment tested as specified above conforms to the requirements of FCC Part 24 Subpart E.

TÜV Product Service Inc is a subcontractor to TÜV Product Service, GmbH according to the principles outlined in ISO/IEC Guide 25 and EN 45001. TÜV Product Service Inc reports apply only to the specific samples tested under stated test conditions. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical components. TÜV Product Service Inc shall have no liability for any deductions, inferences or generalizations drawn by the client or others from TÜV Product Service Inc issued reports. This report is the confidential property of the client. As a mutual protection to our clients, the public and ourselves, extracts from the test report shall not be reproduced except in full without our written approval. This report shall not be used by the client to claim product endorsement by NVLAP or any agency of the US government.

TÜV Product Service Inc and its professional staff hold government and professional organization certifications and are members of AAMI, ACIL, AEA, ANSI, IEEE, NVLAP, and VCCI

All measurement instrumentation is traceable to the National Institute of Standards and Technology (NIST) and is calibrated annually.

Conducted emissions on the 60 Hz power interface of the EUT are measured in the frequency range of 450 kHz to 30 MHz. The measurements are performed using a receiver, which has CISPR characteristic bandwidth and quasi-peak detection, and a Line Impedance Stabilization Network (LISN), with 50 Ω /50 μ H (CISPR 16) characteristics. Table top equipment is placed on a non-conducting table 80 centimeters above the floor and is positioned 40 centimeters from the vertical ground plane (wall) of the screen room. In some cases, a pre-scan using a spectrum analyzer is initially performed on the units comprising the system under test to locate the highest emissions. If the minimum passing margin appears to be less than 20 dB with a peak mode measurement, the emissions are re-measured using a tuned receiver or spectrum analyzer with quasi-peak and average detection and recorded on the data sheets.

24.232 Effective Radiated Power Limit

The Effective Radiated Power Limit measurements were tested at the following test location :

☐ - Test not applicable

■ - ADC facility

Test equipment used :

Model Number	Manufacturer	Description	Serial Number	Cal Due
■ - 8563E	Hewlett-Packard	Spectrum Analyzer	MC27690	Apr 02
■ - 6810.17.A	Huber+Suhner	Attenuator		CNR

All measurement instrumentation is traceable to the National Institute of Standards and Technology (NIST) and is calibrated annually. Equipment labeled CNR (Calibration Not Required) is verified and compensated for with NIST traceable calibrated equipment.

This measurement was made as a direct conducted emission measurement. The output from the EUT antenna connector was connected directly to the spectrum analyzer, which was set up with a 1 MHz resolution bandwidth. The spectrum analyzer level was offset by 20 dB to compensate for the attenuator placed between the EUT and the analyzer, and by 2 dB for the measured cable loss between the EUT and the analyzer.

ERP data on next page

**Effective Isotropic Radiated Power Limit Test for the ADC Inc.
Digivance 1900 MHz ICS System.
Models DGVI-312110DHU and DGVI-313110DRU.
Per FCC CFR 47 Part 24.232 (b) and (c)**

This measurement was made as a direct conducted emission measurement. The output from the EUT antenna connector was connected to the spectrum analyzer as shown below. A CW signal was used at the low , mid and high parts of the selected band. The spectrum analyzer level was offset by 35dB to compensate for attenuators and cable losses between the EUT and analyzer.

The maximum specified TX output power from the EUT antenna port is 19dBm.
The minimum specified TX output power from the EUT antenna port is 13dBm.
The maximum gain antenna available for use with the EUT has a gain of 8dBi.
From the following equations:

Peak Output of EUT at antenna Connector (dBm) + Gain of Antenna (dBi) = Peak TX Power (dBm) EIRP
 $10 * \log_{10}(\text{Peak TX Power} * E^3 \text{ Watts}) = \text{Peak TX Power (dBm) EIRP}$

19dBm + 8dBi = 27dBm EIRP
 27dBm EIRP = 0.5 Watts EIRP

Note: EUT is only specified for indoor use only with temperature range of 0 to 50 degrees C.

Occupied Bandwidth Modulation Test for ADC Inc. Digivance 1900 MHz ICS System Models DGV1-312110DHU and DGV1-313110DRU.

An input/output Occupied Bandwidth test was done with 3 different modulation types: FM (8KHz, 1KHz), TDMA, and CDMA. The purpose was to determine the amount of distortion added to different types of modulation schemes by the EUT. The following plots show input signals vs. output signals.

24.238 Emission Limits

The Emission limitations for cellular measurements were performed at the following test location :

- - ADC facility
- - Wild River Lab Large Test Site (Case Emissions Test)

TÜV Product Service Test equipment used for Case Emissions Test:

	TUV ID	Model Number	Manufacturer	Description	Serial Number	Cal Due

Cal Code B = Calibration verification performed internally.

Cal Code Y = Calibration not required when used with other calibrated equipment.

All measurement instrumentation is traceable to the National Institute of Standards and Technology (NIST) and is calibrated annually. Equipment labeled CNR (Calibration Not Required) is verified and compensated for with NIST traceable calibrated equipment.

Emissions Limits Data on following pages

**Conducted Emission Limits Test for ADC Inc. Digivance 1900 MHz ICS System
Models DGV1-312110DHU and DGV1-313110DRU.
Per FCC CFR 47 Part 24.238 Emission Limits**

The out of band emissions were measured directly from the EUT antenna output with a spectrum analyzer from 30MHz to the 10th harmonic of the highest carrier frequency . Test signals used were: CW, FM (1kHz, 8KHz), TDMA and CDMA. The different signals were input one at a time to the EUT. In all cases, the out of band emissions were less than -13dBm from the equation $(19\text{dBm} - [43 + 10 \log(0.08\text{W})])$

Band edge compliance is also demonstrated using a CW signal at the upper and lower limits of the band and a resolution bandwidth of 300Hz per 24.238 (b).
