2. Test Statement

2.1 Antenna Statement

The attached antenna on this PCMCIA card (Direct Sequence Transmitter)
Will be:

- a. Solder on PCB or
- b. The connector will be fixed by strong adhensive material.
(the model# of adhensive material is R25
manufacture is: chandar)

2.2 Departure form documented policies, procedures, or specifications:

Were there any departures from documented policies, procedures, or specifications?
No X Yes . If yes, please explain.

2.3 Test Statement

- This EUT is a peripheral of PC.
- The certificate or report shall not be reproduced except in full, without the written approval of **SRT Lab.**, This report must not be used by the client to claim product endorsement by **NVLAP** or any agency of the US Government.
- Partial tests (Power Spectral Density & Processing Gain) were tested at Computer & Communications Reseach Laboratory. All test condition were audited by **SRT LAB's** engineer.

3. EUT Modifications

The following accessories were added to the EUT during testing:

Did not have any modification by SRT Lab.

4. Conducted Power Line Test

4.1 Test Equipment

The following test equipment was used during the conducted power line test:

4.2 Configuration of the EUT

The EUT was configured according to ANSI C63.4 - 1992. All interface ports were connected to the appropriate peripherals. All peripherals and cables are listed below.

EUT:

Device	Manufacturer	Model #	FCC ID
Wireless LAN Card	Computer & Communication Lab.	LAN2GO-DS	FACLAN2GO-DS

Peripherals:

Device	Manufacturer	Model # / Serial #	FCC ID
Printer	HP	2225C	DSI6XU2225

4.3 EUT Operating Condition:

Operating condition is according to ANSI C63.4 - 1992. The operating speed of the computer was 100MHz.

1. EUT power on.
2. Run Tx and Rx testing program:
3. Put PCMCIA card (EUT) into notebook and set up channel.
4. Send signal out.

Remark: 1. Three channels were tested.

- * Channel 1: 2.412GHz
- * Channel 6: 2.437GHz
- * Channel 11: 2.462GHz

**2. CPU Type: Pentium 100
Clock Chip: 66 MHz**

4.4 Test Procedure

The EUT was test according to ANSI C63.4 - 1992. The conducted test was performed in an anechoic chamber. The frequency spectrum from 0.45 MHz to 30 MHz was investigated. The LISN used was 50 Ohms/50 μ Henry as specified by section 5.1 of ANSI C63.4 - 1992. Cables and peripherals were moved to find the maximum emission levels for each frequency.

5.2 Configuration of the EUT

Same as section 4.2 of this report.

5.3 EUT Operating Condition

Same as section 4.3 of this report.

5.4 Test Procedure

The EUT was tested according to **ANSI C63.4 - 1992**. The radiated test was performed at SRT lab's open site. This site is on file with the FCC laboratory division, reference 31040/sit.

The frequency spectrum from 30MHz to 25Hz was investigated. The measurements **under 1000 MHz** with resolution bandwidth of 120KHz are quasi-peak reading made at three using an adjustable dipole antenna. Peripherals, cables, .EUT orientation, and antenna height were varied to find the maximum emission for each frequency.

The measurements **above 1000MHz** with a resolution bandwidth of 1MHz are peak reading at a distance of three meters with a horn antenna.
(some points were tested at one meter, the test results will be calculated to 3 meters).

* Optional For Radiated Tests

Test configuration for tabletop equipment
(Top View)

- EUT, peripherals, between peripherals the distance is fixed at 10 cm on edge of the turn table.

5.6 Radiated Emission Limit

- a. Inside band of spurious: under 20dB of funder metal.
- b. Harmonic: * under 20dB of fund.
- c. Restricted Band Emission: over 1GHz, the limit is 54dBuV at 3M.
- d. Under 1GHz:

Class B

Frequency (MHz)	Distance (m)	Field Strength ($\mu\text{V/m}$)
30 - 88	3	100
88 - 216	3	150
216 - 960	3	200
Above 960	3	500

Class A

Frequency (MHz)	Distance (m)	Field Strength ($\mu\text{V/m}$)
30 - 88	3	316.3
88 - 216	3	473.2
216 - 960	3	631.0
Above 960	3	1000.0

Note:

1. In the emission tables above, the tighter limit applies at the band edges.
2. Distance refers to the distance between measuring instrument, antenna and the closest point of any part of the device or system.

5.7 Radiated Emission Test Result

The frequency spectrum from **30MHz to 2GHz** was investigated. The values **under 1GHz** with a resolution bandwidth of 120KHz are quasi-peak reading made at **3** meters. The measurements **above 1GHz** with a resolution bandwidth of 1MHz are peak reading at a distance of **3** meters.

9.2 Test set-up

9.3 Test Procedure

1. TX power on.
2. Jamming signal power off.
3. Test TX power.
4. Jamming signal power on.
5. Adjust central frequency.
6. Adjust jamming signal power then communication analyzer will show $BER \leq 10^{-5}$
7. TX power off.
8. Check jamming power.
9. Compare the jamming signal power and TX power.
10. Change frequency, each step is 50KHz.

9.4 Test Limit

1. $S/N + J/S + L \geq 10\text{dB}$.
2. BER is small or equal than 10^{-5} .
3. 20% error is allowed.

9.5 Test Result

1. When BER is less than 10^{-5} , the S/N is 9.8dB for BPSK.
2. All processing gain are over 10dB. So, all can meet FCC limits.

* Channel: 6

* Center frequency: 2437MHz

* Test step: 50KHz/step

* Test range: 2426.00MHz to 2448.95MHz

* Test condition

TX	ON	ON	OFF
Jamming	OFF	ON	ON
dBm	-12.00	-10.63	Below table

Processing Gain = $(S/N)_0 + M_j + L_{sys} \geq 10\text{dB}$

$(S/N)_0$: when BER is less than or equal 10^{-5} , the $(S/N)_0$ is 9.8dB for BPSK

L_{sys} : $-10.63 - (-12.00) = 1.37\text{dB}$

$M_j = J/S$,

$S = -12.00\text{dBm}$

If J is over -13.17dBm ,

then Processing Gain (PG) will over 10dB

* Test result: all J signals are over -13.17dBm
so, all PG $\geq 10\text{dB}$

* Channel: 6 Center Frequency: 2437MHz

RE: FCC ID: FACLAN2GO-DS

Confirmation #: EA91775

Dear Mr. Richard Fabina:

This is in response to your inquiry for FCC ID: FACLAN2GO-DS.

1. When SRT test the EUT, We used HP Notebook PC as peripheral. The Notebook PC's FCC ID is: B945500.
2. For this EUT, it follows the IEEE 802.11 protocol and Harris Prism chipset is used. The data rate is 1Mbps using BPSK modulation or 2Mbps using QPSK, so the symbol rate is always 1 MHz. The chipping rate is 11M chips per second. The processing gain of DS Spread Spectrum is usually defined as the chipping rate over symbol rate, which is over $11M/1M=11=10.4dB$ in this EUT.
3. The factory will use permanent adhesive. It is an instanous cyanoacrylate adhesive. (Model # R25, made by Chandar)
4. This EUT power is 10mW. The emission test data is 110.5 dBuV at 3 meters. The test distance is 1 meter, but the data already changed to 3 meters condition. Please check the others freq. limits data. It is 3 meters data.
5. Attached are channel 6 processing gain test data. All three channels we already tested .

Above are applicant answering. If you need more information or have any questions, please feel free to contact SRT ,
THANK YOU VERY MUCH!

Sincerely,

ONLY ONE ELECTRONIC REPLY PER REFERENCE NUMBER (shown at the end of this fax) IS ACCEPTED ELECTRONICALLY VIA THE INTERNET. PLEASE DO NOT SUBMIT A PARTIAL REPLY OR ASK QUESTIONS ABOUT THIS REQUEST FOR ADDITIONAL INFORMATION VIA THE INTERNET. PARTIAL REPLIES MUST BE SENT VIA STANDARD METHODS LIKE FAX, EMAIL OR MESSENGER SERVICE. IF YOU HAVE QUESTIONS ABOUT THIS REQUEST FOR ADDITIONAL INFORMATION, CONTACT MR. RICHARD FABINA VIA EITHER TELEPHONE AT 301-362-3027 BETWEEN 1:00 AND 3:30 P.M. EASTERN TIME OR FAX AT 301-344-2050 ANYTIME. YOUR COOPERATION IS APPRECIATED.

1. This device is a composite device that consists of a spread spectrum transmitter and a personal computer (PC) peripheral. The transmitter requires Certification. The PC peripheral may either be authorized under the Certification or Declaration of Conformity (DoC) procedures. You have two options below, either A or B:

(A) If you intend to obtain Certification for the PC peripheral portion of this device, please submit another application using the same FCC ID number with the correct fee for Certification to Equipment Approval Services (EAS) in Pittsburgh, PA. Do not submit this application with fee directly to the FCC lab. Applications with a fee attached must be submitted to EAS in Pittsburgh for processing of the fee. See Section 1.1103 for the complete address of EAS.

The fees for equipment authorization were changed effective September 14, 1998. Certification of a PC peripheral is now \$940.00. If you file for Certification of the PC peripheral portion of this device, you must pay the new fee of \$940.00.

(B) If you intend to obtain DoC for the PC peripheral portion of this device, please provide the following:

- (a) the name of the accredited test laboratory that performed the DOC testing in accordance with Section 2.1075(a)(3)(ii),
- (b) the compliance information described in Sections 2.1077(a)(1) through (3) (i.e., identification of the product by name or model number, and the identification, by name, address and telephone number, of the responsible party as defined in Section 2.909), and
- (c) a sample of the DoC label and its location on the device.

- 2. An operational description of this transmitter in accordance with Section 2.1033(b)(4) of the FCC Rules. At a minimum, this description must include the data rates, symbol rates, chipping or spreading rate and the theoretical processing gain and how you determine it.
- ✓ 3. Connection of the antenna to this transmitter with an adhesive must be done at the factory with a permanent adhesive or glue. Please have the applicant confirm that the antenna will be attached at the factory and describe the type of permanent adhesive that will be used.
- ✓ 4. The output power measured from this device during radiated emission measurements does not agree with the output power listed in the test report. You state that this device has 10 milliwatts of output power but the maximum field strength reading of 110.5 dBuV/m @ 1 meter converts to only 3.7 milliwatts using the following formula: $P = (Ed)^2/30$, where $d = 1$ meter and $E = 3.35$ volts/meter. Unless you remeasure all the radiated emission levels to show an output power closer to the 10 milliwatts described in the test report, I will grant this transmitter with the maximum output power listed as 3.7 milliwatts.
- 5. For your information - Processing gain tests need only be performed on one channel, not three channels as you have done. In addition, the Commission requires the readings of the jammer signal to be reported at 50 kHz intervals where they are measured not reported as a range as you have done this time. We will accept this form of data reporting this time only. Future test results submitted in this manner will have to be resubmitted in the standard format that we accept. If you have any questions about this matter, please contact Mr. Richard Fabina at one of the telephone numbers listed above.

Dear Sir/Madam:

This is to serve as proper written authorization that Spectrum Research and Testing Laboratory, Inc. 1603 Skinners Turn road, Owings, Maryland 20736, will act as our representative in all matters relating to FCC applications for equipment approval. This includes the signing of all related documents, the transmitting of required fees, and receiving correspondence and notifications from FCC. All acts performed by Spectrum Research and Testing Laboratory, Inc. especially modifications to our equipment under testing will be carried out on our behalf.

Meanwhile by checking yes, the applicant certifies that, in case of an individual applicant, he or she is not subject to a denial of federal benefits, that includes FCC benefits, pursuant to section 5301 of the Anti-Drug Abuse Act of 1988, 21 U.S.C. 862, or in the case of a non-individual applicant (e.g., corporation, partnership or other unincorporated association), no party to the applicant is subject to a denial of federal benefits, that includes FCC benefits, pursuant to that section. For a definition of a "party" for these purposes see 47 C.F.R. 1.2002(b).

☒ Yes ☐ No

If you have any questions regarding our applications for equipment approval, please contact Spectrum Research and Testing Laboratory, Inc. by calling (301) 855-2262.

5.3 EUT Operating Condition:

Operating condition is according to ANSI C63.4 - 1992. The operating speed of the computer was 100MHz.

- 1. EUT power on.**
- 2. Run Tx and Rx testing program:**
- 3. Put PCMCIA card (EUT) into notebook and set up channel.**
- 4. Send signal out.**

Remark: 1. Three channels were tested.

- * Channel 1: 2.412GHz**
- * Channel 6: 2.437GHz**
- * Channel 11: 2.462GHz**

2. CPU Type: Pentium 100

5.4 Test Procedure

The EUT was test according to ANSI C63.4 - 1992. The conducted test was performed in an anechoic chamber. The frequency spectrum from 0.45 MHz to 30 MHz was investigated. The LISN used was 50 Ohms/50 μ Henry as specified by section 5.1 of ANSI C63.4 - 1992. Cables and peripherals were moved to find the maximum emission levels for each frequency.

6.2 Configuration of the EUT

Same as section 5.2 of this report.

6.3 EUT Operating Condition

Same as section 5.3 of this report.

6.4 Test Procedure

The EUT was tested according to **ANSI C63.4 - 1992**. The radiated test was performed at SRT lab's open site. This site is on file with the FCC laboratory division, reference 31040/sit.

The frequency spectrum from 30MHz to 25Hz was investigated. The measurements **under 1000 MHz** with resolution bandwidth of 120KHz are quasi-peak reading made at three using an adjustable dipole antenna. Peripherals, cables, .EUT orientation, and antenna height were varied to find the maximum emission for each frequency.

The measurements **above 1000MHz** with a resolution bandwidth of 1MHz are peak reading at a distance of three meters with a horn antenna.
(some points were tested at one meter, the test results will be calculated to 3 meters).

30 - 88	3	316.3
88 - 216	3	473.2
216 - 960	3	631.0
Above 960	3	1000.0

Note:

1. In the emission tables above, the tighter limit applies at the band edges.
2. Distance refers to the distance between measuring instrument, antenna and the closest point of any part of the device or system.

6.7 Radiated Emission Test Result

The frequency spectrum from **30MHz to 2GHz** was investigated. The values **under 1GHz** with a resolution bandwidth of 120KHz are quasi-peak reading made at **3** meters. The measurements **above 1GHz** with a resolution bandwidth of 1MHz are peak reading at a distance of **3** meters.

4. Jamming signal power on.
5. Adjust central frequency.
6. Adjust jamming signal power then communication analyzer will show $BER \leq 10^{-5}$
7. TX power off.
8. Check jamming power.
9. Compare the jamming signal power and TX power.
10. Change frequency, each step is 50KHz.

10.4 Test Limit

1. $S/N + J/S + L \geq 10\text{dB}$.
2. BER is small or equal than 10^{-5} .
3. 20% error is allowed.

10.5 Test Result

1. When BER is less than 10^{-5} , the S/N is 9.8dB for BPSK.
2. All processing gain are over 10dB. So, all can meet FCC limits.

* Channel: 11

* Center frequency: 2462MHz

* Test step: 50KHz/step

* Test range: 2451.00MHz to 2437.95MHz

* Test condition

TX	ON	ON	OFF
Jamming	OFF	ON	ON
dBm	-14.72	-14.24	Below table

Processing Gain = $(S/N)_0 + M_j + L_{sys} \geq 10\text{dB}$

$(S/N)_0$: when BER is less than or equal 10^{-5} , the $(S/N)_0$ is 9.8dB for BPSK

L_{sys} : $-14.24 - (-14.72) = 0.48\text{dB}$

$M_j = J/S$,

$S = -14.72\text{dBm}$

If J is over -15.00dBm ,

then Processing Gain (PG) will over 10dB

* Test result: all J signals are over -15.00dBm

so, all PG $\geq 10\text{dB}$

* Channel: 11
