Test Report Prepared by: Joseph D. Brunett

Summary

Tests for compliance with FCC Regulations Part 15, Subpart C, and Industry Canada RSS-210/GEN, were performed on Michelin model(s) RV3.0. This device is subject to the Rules and Regulations as a Transmitter.

In testing completed on June 21, 2006, the device met the allowed specifications for radiated emissions by 2.2 dB (see p. 7). The device meets the Class A digital emissions limits by more than 1.2 dB (see p. 7) and the battery charger supplied with the device meets the Class A power line conducted emissions limit by more than 16.9 dB (see p. 8).

University of Michigan Radiation Laboratory
FCC Part 15, IC RSS-210/GEN - Test Report No. 415031-313

1. Introduction

Michelin model RV3.0 was tested for compliance with FCC Regulations, Part 15, adopted under Docket 87-389, April 18, 1989 as subsequently amended, and with Industry Canada RSS-210/Gen, Issue 6, September 2005. The tests were performed at the University of Michigan Radiation Laboratory Willow Run Test Range following the procedures described in ANSI C63.4-2003 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". The Site description and attenuation characteristics of the Open Area Test Site are on file with FCC Laboratory, Columbia, Maryland (FCC Reg. No: 91050) and with Industry Canada, Ottawa, ON (File Ref. No: IC 2057).

2. Equipment Used

The pertinent test equipment commonly used in our facility for measurements is listed in Table 2.1 below. The middle column identifies the specific equipment used in these tests.

Table 2.1 Test Equipment.

3. Configuration and Identification of Device Under Test (DUT)

3.1 Device Description

The DUT was designed and manufactured by Michelin, 515 Michelin Road, Greenville, SC 29615. It is identified as:

Michelin MEMS Hand Held Transceiver
Model(s): RV3.0
Charger: Stontronics Limited Model No. EPA-201D-15
FCC ID: FI5-RV30
IC: 5056A-RV30

3.2 Models and Modes of Operation

There is only one model of the device. The DUT is composed of separate 433.92 MHz transmitter and superheterodyne receiver modules. This report details the emissions relating to the transmitter portion of the device. The DUT contains a 433.92 MHz FSK transmitter which can decode and encode Michelin tire pressure data it receives (retransmission is only performed after signal decoding and identification). It is designed to communicate with onboard automobile Tire Pressure transmitters and an associated truck mounted transceiver. It is housed in a plastic case approximately 4.5 by 10 by 3 inches. Two exterior monopole antennas are permanently attached (glued on) by the manufacturer for use with the module. Only one acts as a transmitter, while both are capable of diversity reception.

3.3 Modes of Operation

The device has the ability to store tire pressure monitor data that it receives and decodes, as well as direct data transmission to an from a truck mounted MEMS transceiver. This device is subject to FCC 15.231(e), and compliance with 15.231(a) is demonstrated in Figure 6.1 of this report. The DUT ceases transmission within 5 seconds after the button is released and cannot be automatically activated by an external event.

3.4 EMI/EMC Relevant Modifications

There were no modifications made to the DUT by this laboratory.

4. Regulatory Limits

The DUT tested falls under the category of an Intentional Radiators and the Digital Devices. For FCC, it is subject to Part 15, Subpart C (Section 15.231(a),(c), & (e),15.209) and Subpart A (Section 15.33). For Industry Canada it is subject to RSS-210 (2.6, 2.7). The applicable testing frequencies with corresponding emission limits are given in Tables 4.1 and 4.2 below.

4.1 Radiated Emission Limits

Table 4.1. General Radiated Emission Limits (FCC: 15.33, 15.35, 15.209; IC: RSS-210, 2.7 Table 2)
(Digital Class B)

Freq. (MHz)	E _{lim} (3m) μ V/m	E _{lim} dB(μ V/m)
30-88	100	40.0
88-216	150	43.5
216-960	200	46.0
960-2000	500	54.0

Note: Average readings apply above 1000 MHz (1 MHz BW)
Quasi-Peak readings apply to 1000 MHz (120 kHz BW)

University of Michigan Radiation Laboratory
FCC Part 15, IC RSS-210/GEN - Test Report No. 415031-313

Table 4.2. Radiated Emission Limits (FCC: 15.231(e), 15.205(a); IC: RSS-210; 2.7 Table 5).
(Transmitter)

Frequency (MHz)	Fundamental Ave. E _{lim} (3m)		Spurious** Ave. E _{lim} (3m)	
	(μV/m)	dB (μV/m)	(μV/m)	dB (μV/m)
260.0-470.0	1500-5000*		150-500	
315.0	2417	67.7	241.7	47.7
433.9	4399	72.9	439.9	52.9
322-335.4 399.9-410 608-614	Restricted Bands		200	46.0
960-1240 1300-1427 1435-1626.5 1660-1710 1718.9-1722.2 2200-2300	Restricted Bands		500	54.0

* Linear interpolation, formula: $E = -2833.2 + 16.67 \cdot f$ (MHz)

** Measure up to tenth harmonic; 120 kHz RBW up to 1 GHz, 1 MHz RBW above 1 GHz

4.3 Exemptions

None.

4.4 Power Line Conducted Emission Limits

Table 4.3 Conducted Emission Limits (FCC/CISPR:15.107; IC: RSS-GEN, 7.2.2 Table 2).

Frequency MHz	Class A (dBμV)		Class B (dBμV)	
	Quasi-peak	Average	Quasi-peak	Average
.150 - 0.50	79	66	66 - 56*	56 - 46*
0.50 - 5	73	60	56	46
5 - 30	73	60	60	50

Notes:

1. The lower limit shall apply at the transition frequency
2. The limit decreases linearly with the logarithm of the frequency in the range 0.15-0.50 MHz:

*Class B Quasi-peak: $\text{dB}\mu\text{V} = 50.25 - 19.12 \cdot \log(f)$

*Class B Average: $\text{dB}\mu\text{V} = 40.25 - 19.12 \cdot \log(f)$

3. 9 kHz RBW

4.5 Supply Voltage Variation

Measurements of the variation in the fundamental radiated emission shall be performed with the supply voltage varied between 85% and 115% of the nominal rated value. For battery operated equipment, the equipment tests shall be performed using a new battery.

5. Test Procedures

5.1 Semi-Anechoic Chamber Radiated Emission Testing

To become familiar with the emission behavior of the DUT, the DUT was first studied and measured in a shielded semi-anechoic chamber. In the chamber is set-up similar to that of an outdoor 3-meter site, with

a turntable, antenna mast, and a ground plane. Instrumentation includes spectrum analyzers and other equipment as needed.

In testing for radiated emissions, a transmitter was provided by the manufacturer that is capable of repeated emissions. It was placed on the test table flat, on its side, and on its end. In the chamber we studied and recorded all the emissions using a Bicone antenna up to 300 MHz and a ridged horn antenna above 200 MHz. The measurements made in the chamber below 1 GHz are used for pre-test evaluation only. The measurements made above 1 GHz are used in pre-test evaluation and in final compliance assessment. We note that for the horn antenna, the antenna pattern is directive and the measurement is essentially that of free space (no ground reflection). Consequently, it is not essential to measure the DUT for both antenna polarizations, as long as the DUT is measured on all three of its major axis. In the chamber we also recorded the spectrum and modulation characteristics of the carrier. These data are presented in subsequent sections.

5.2 Open Area Test Site (OATS) Radiated Emission Testing

After the chamber measurements are complete, emissions are re-measured on the outdoor 3-meter open area test site at the fundamental and harmonics up to 1 GHz using tuned dipoles and/or a high frequency biconical antenna. The DUT is placed on the test table flat, on its side, and on its end, and worst case emissions are recorded. Photographs included in this filing show the DUT on the OATS.

5.3 Field Calculation for Radiated Emission Measurements

To convert the dBm's measured on the spectrum analyzer to dB(μ V/m), we use expression

$$E_3(\text{dB}\mu\text{V/m}) = 107 + P_R + K_A - K_G$$

where P_R = power recorded on spectrum analyzer, dB, measured at 3m
 K_A = antenna factor, dB/m
 K_G = pre-amplifier gain, including cable loss, dB

When presenting the data, at each frequency the highest measured emission under all of the possible orientations is given. Computations and results are given in Table 5.1. There we see that the DUT meets the limit by 2.2 dB.

5.4 Power Line Conducted Emission Testing

The DUT is powered by six, 1.5 VDC batteries interior to the case. The power line conducted emissions from the AC battery charger supplied with the device are subject to the conducted emissions limits. Conducted emissions were measured using a LISN in the standard set-up and results are reported in Table 5.2. A photograph of the set-up is included at the end of this report.

6. Test Results

6.1 Correction For Pulse Operation

When the transmitter is activated it can, in the worst case, transmit one FSK packet with an on time of 20.0 ms in any given 100 ms window. See Figure 6.1. Computing the duty factor results in:

$$K_E = 20.0 \text{ ms} / 100 \text{ ms} = 0.200 \text{ or } -14.0 \text{ dB.}$$

6.2 Emission Spectrum

Using the ridge-horn antenna and DUT placed in its aperture, emission spectrum was recorded and is shown in Figure 6.2.

6.3 Bandwidth of the Emission Spectrum

The measured spectrum of the signal is shown in Figure 6.3. The allowed (-20 dB, 99%) bandwidth is 0.25% of 433.92 MHz, or 1.085 MHz. From the plot we see that the -20 dB bandwidth is 90.0 kHz, and the center frequency is 433.92 MHz.

6.4 Effect of Supply Voltage Variation and Test Battery Voltages

The DUT has been designed to be powered by a set of six, 1.5 VDC rechargeable batteries affixed within the chassis. The DUT was tested using a fully charged battery. Voltage variation measurements were not performed.

Batteries:	before testing	$V_{oc} = 6.0 \text{ V}$
	after testing	$V_{oc} = 5.9 \text{ V}$

Summary

Tests for compliance with FCC Regulations Part 15, Subpart B, and Industry Canada RSS-GEN, were performed on Michelin model RV3.0. This device is subject to the Rules and Regulations as a Receiver.

In testing completed on June 21, 2006, the device tested in the worst case met the allowed Class B specifications for receiver radiated emissions by 8.1 dB (see p. 6). Please see the associated transmitter test report for intentional and digital emissions measurements relating to this device.

University of Michigan Radiation Laboratory
FCC Part 15, IC RSS-210/Gen - Test Report No. 415031-314

1. Introduction

Michelin model RV3.0 was tested for compliance with FCC Regulations, Part 15, adopted under Docket 87-389, April 18, 1989 as subsequently amended, and with Industry Canada RSS-210, Issue 6 and RSS-Gen, Issue 1, September, 2005. The tests were performed at the University of Michigan Radiation Laboratory Willow Run Test Range following the procedures described in ANSI C63.4-2003 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz". The Site description and attenuation characteristics of the Open Site facility are on file with FCC Laboratory, Columbia, Maryland (FCC Reg. No: 91050) and with Industry Canada, Ottawa, ON (File Ref. No: IC 2057).

2. Test Procedure and Equipment Used

The pertinent test equipment commonly used in our facility for measurements is listed in Table 2.1 below. The middle column identifies the specific equipment used in these tests.

Table 2.1 Test Equipment.

Test Instrument	Eqpt. Used	Manufacturer/Model
Spectrum Analyzer (0.1-1500 MHz)		Hewlett-Packard, 182T/8558B
Spectrum Analyzer (9kHz-22GHz)	X	Hewlett-Packard 8593A SN: 3107A01358
Spectrum Analyzer (9kHz-26GHz)	X	Hewlett-Packard 8593E, SN: 3412A01131
Spectrum Analyzer (9kHz-26GHz)		Hewlett-Packard 8563E, SN: 3310A01174
Spectrum Analyzer (9kHz-40GHz)		Hewlett-Packard 8564E, SN: 3745A01031
Power Meter		Hewlett-Packard, 432A
Power Meter		Anritsu, ML4803A/MP
Harmonic Mixer (26-40 GHz)		Hewlett-Packard 11970A, SN: 3003A08327
Harmonic Mixer (40-60 GHz)		Hewlett-Packard 11970U, SN: 2332A00500
Harmonic Mixer (75-110 GHz)		Hewlett-Packard 11970W, SN: 2521A00179
Harmonic Mixer (140-220 GHz)		Pacific Millimeter Prod., GMA, SN: 26
S-Band Std. Gain Horn		S/A, Model SGH-2.6
C-Band Std. Gain Horn		University of Michigan, NRL design
XN-Band Std. Gain Horn		University of Michigan, NRL design
X-Band Std. Gain Horn		S/A, Model 12-8.2
X-band horn (8.2- 12.4 GHz)		Narda 640
X-band horn (8.2- 12.4 GHz)		Scientific Atlanta , 12-8.2, SN: 730
K-band horn (18-26.5 GHz)		FXR, Inc., K638KF
Ka-band horn (26.5-40 GHz)		FXR, Inc., U638A
U-band horn (40-60 GHz)		Custom Microwave, HO19
W-band horn(75-110 GHz)		Custom Microwave, HO10
G-band horn (140-220 GHz)		Custom Microwave, HO5R
Bicone Antenna (30-250 MHz)	X	University of Michigan, RLBC-1
Bicone Antenna (200-1000 MHz)	X	University of Michigan, RLBC-2
Dipole Antenna Set (30-1000 MHz)	X	University of Michigan, RLDP-1,-2,-3
Dipole Antenna Set (30-1000 MHz)		EMCO 2131C, SN: 992
Active Rod Antenna (30 Hz-50 MHz)		EMCO 3301B, SN: 3223
Active Loop Antenna (30 Hz-50 MHz)		EMCO 6502, SN:2855
Ridge-horn Antenna (300-5000 MHz)	X	University of Michigan
Amplifier (5-1000 MHz)	X	Avantak, A11-1, A25-1S
Amplifier (5-4500 MHz)	X	Avantak
Amplifier (4.5-13 GHz)		Avantek, AFT-12665
Amplifier (6-16 GHz)		Trek
Amplifier (16-26 GHz)		Avantek
LISN Box		University of Michigan
Signal Generator	X	Hewlett-Packard 8657B

3. Configuration and Identification of Device Under Test

3.1 Design and Identification of the Device

The DUT was designed and manufactured by Michelin, 515 Michelin Road, Greenville, SC 29615. It is identified as:

Michelin MEMS Hand Held Transceiver
Model(s): RV3.0
Charger: Stontronics Limited Model No. EPA-201D-15
FCC ID: FI5-RV30
IC: 5056A-RV30

3.2 Models

There is only one model of the device. The DUT is composed of separate 433.92 MHz transmitter and superheterodyne receiver modules. This report details the emissions relating to the receiver portion of the device. The DUT has a shielded plastic case approximately 4.5 by 10 by 3 inches. Two exterior monopole antennas are permanently attached (glued on) by the manufacturer for use with the module. Only one acts as a transmitter, while both are capable of diversity reception.

3.1 Modifications Made

There were no modifications made to the DUT by this laboratory.

4. Emission Limits

The DUT tested falls under Part 15, Subpart B, "Unintentional Radiators". The pertinent test frequencies, with corresponding emission limits, are given in Tables 4.1 and 4.2 below.

4.1 Radiated Emission Limits

Table 4.1. Radiated Emission Limits (Ref: FCC 15.33, 15.35, and 15.109; IC RSS-210, 2.6 Table 2).

Freq. (MHz)	Elim (3m) $\mu\text{V/m}$	Elim (3m) $\text{dB}(\mu\text{V/m})$
30-88	100	40.0
88-216	150 $\mu\text{V/m}$	43.5
216-960	200 $\mu\text{V/m}$	46.0
960-2000	500 $\mu\text{V/m}$	54.0

Note: Quasi-Peak readings apply to 1000 MHz (120 kHz BW)
Average readings apply above 1000 MHz (1 MHz BW)

4.2 Power Line Conducted Emission Limits

Table 4.3 Conducted Emission Limits (FCC:15.107 (CISPR); IC: RSS-Gen, 7.2.2 Table 2).

Frequency MHz	Class A (dB μV)		Class B (dB μV)	
	Quasi-peak	Average	Quasi-peak	Average
.150 - 0.50	79	66	66 - 56*	56 - 46*
0.50 – 5.0	73	60	56	46
5.0 – 30.0	73	60	60	50

Notes:

1. The lower limit shall apply at the transition frequency
2. The limit decreases linearly with the logarithm of the frequency in the range 0.15-0.50 MHz:
*Class B Quasi-peak: $\text{dB}\mu\text{V} = 50.25 - 19.12 \cdot \log(f)$
*Class B Average: $\text{dB}\mu\text{V} = 40.25 - 19.12 \cdot \log(f)$
3. 9 kHz RBW

4.3 Antenna Power Conduction Limits

Ref: FCC 15.111(a). $P_{\text{max}} = 2 \text{ nW}$; for frequency range see Table 4.1.

4.5 Supply Voltage Variation

Measurements of the variation in the fundamental radiated emission shall be performed with the supply voltage varied between 85% and 115% of the nominal rated value. For battery operated equipment, the equipment tests shall be performed using a new battery.

5. Emission Tests and Results

Even though the FCC and Industry Canada specify radiated and conductive emissions be measured using the Quasi-Peak and/or average detection schemes, we normally use peak detection since Quasi-Peak is cumbersome to use with our instrumentation. In case the measurement fails to meet the limits or the measurement is near the limit, it is re-measured using the appropriate detection scheme. Note, a peak detected signal is always greater than or equal to the Quasi-Peak or average detected signal. In this report the margin of compliance may be better, but not worse than that indicated. The type of detection used is indicated in the data table, Table 5.1.

5.1 Anechoic Chamber Radiated Emission Tests

To become familiar with the emission behavior of the DUT, the device was first studied and measured in a shielded semi-anechoic chamber. In the chamber is a set-up similar to that of an outdoor 3-meter site, with a turntable, antenna mast, and a ground plane. Instrumentation includes spectrum analyzers and other equipment as needed.

To study and test for radiated emissions, the DUT was powered by a laboratory power supply at 22 VDC. The receiver was activated, attached to a Styrofoam block, and placed on the test table on each of the three axis. At each orientation, the table was rotated to obtain maximum signal for vertical and horizontal emission polarizations. This sequence was repeated throughout the required frequency range. In the chamber we studied and recorded all the emissions using a ridge-horn antenna, which covers 200 MHz to 5000 MHz, up to 2 GHz. In scanning from 30 MHz to 2.0 GHz, there were no spurious emissions observed. Detection of the LO required the addition of an LNA. Figures 5.1 and 5.2 show emissions measured 0-1000 MHz and 1000-2000 MHz, respectively. These measurements are made with a ridge-horn antenna at less than 3m distance, with spectrum analyzer in peak hold mode and the receiver rotated in all orientations. The measurements up to 1000 MHz (Fig. 5.1) are used for initial evaluation only, while those above 1000 MHz (Fig. 5.2) are used in final assessment for compliance.

5.2 Open Area Test Site Radiated Emission Tests

After the chamber measurements are complete, emissions are re-measured on the outdoor 3-meter open area test site up to 1 GHz using tuned dipoles and/or a high frequency biconical antenna. The measurements were made with a spectrum analyzer using 120 kHz IF bandwidth and peak detection mode, and, when appropriate, using Quasi-Peak or average detection (see Section 5.0). Sometimes lower IF bandwidth is used to help bring signals out of noise and this is noted in the data table. The DUT is placed on the test table flat, on its side, and on its end, and worst case emissions are recorded. Photographs included in this filing show the DUT on the OATS.

The emissions from digital circuitry were measured using a standard Bicone. These results are also presented in Table 5.1.

5.3 Computations and Results for Radiated Emissions

To convert the dBm's measured on the spectrum analyzer to dB(μ V/m), we use expression

$$E_3(\text{dB}\mu\text{V/m}) = 107 + P_R + K_A - K_G$$

where P_R = power recorded on spectrum analyzer, dB, measured at 3m
 K_A = antenna factor, dB/m
 K_G = pre-amplifier gain, including cable loss, dB

When presenting the data, at each frequency the highest measured emission under all of the possible orientations is given. Computations and results are given in Table 5.1. There we see that the DUT meets the limit by 8.1 dB.

5.4 Conducted Emission Tests

Please see the associated transmitter report for power line conducted emissions test results.

6. Other Measurements

6.1 Emission Spectrum

The only detectable RF emission occurs at the LO or 2 x LO. The emission spectrum is measured typically over 1 MHz span. This data is taken with the DUT close to antenna and hence amplitudes are relative. The plot is shown in Figure 6.1.

6.2 Effect of Supply Voltage Variation

The DUT has been designed to be powered by a set of six, 1.5 VDC rechargeable batteries affixed within the chassis. The DUT was tested using a fully charged battery. Voltage variation measurements were not performed.

6.3 Operating Voltage and Current

Batteries:	before testing	$V_{oc} = 6.0 \text{ V}$
	after testing	$V_{oc} = 5.9 \text{ V}$
