TEST FACILITY AND EQUIPMENT LIST

FACILITIES

Radiated ANSI C63.4 (FCC OET/55) open field 3 meter test range. This test range is protected from the cold and moisture by a non-conductive enclosure.

Conducted 2.5m Anechoic Chamber

EQUIPMENT

Hewlett-Packard spectrum analyzer # 8554 RF & 141T video.
Anritsu 2601 A spectrum analyzer.
Advantest R3261A Spectrum Analyzer
Hewlett-Packard RF generator # 8640 B with an 002 doubler
Hewlett-Packard attenuator 30 dB # 11708A.
Narda 20 watt (20 dB) attenuator
Compliance Design P950 Preamp (16 dB)..... 25 MHZ - 1.0 GHZ
A.H. Systems biconical antenna;20 MHZ - 330 MHZ
A.H. Systems log periodic antenna;300 MHZ - 1.8 GHZ
Eaton dipole antennas; T1, T2, T325 MHZ - 1.0 GHZ
CDI Roberts dipole antennas; T1, T2, T3 & T4.....25 MHZ - 1.0 GHZ

NOTE:

The Anritsu 2601 A spectrum analyzer, the Hewlett-Packard spectrum analyzer and the Advantest R3261A spectrum analyzer are calibrated annually, and that calibration is directly traceable to the National Research Council of Canada (NRC). This equipment is only used by qualified technicians and only for the purpose of EMI measurements. The three meter test range has been carefully evaluated to the ANSI document C63.4 and will be remeasured for reflections and losses every three years.

Attention: Garry Gallagher

Re: Measurement facility located at Roseville
(3 meter site)

Gentlemen:

Your submission of the description of the subject measurement facility has been reviewed and found to be in compliance with the requirements of Section 2.948 of the FCC Rules. The description has, therefore, been placed on file and the name of your organization added to the Commission's list of facilities whose measurement data will be accepted in conjunction with applications for certification or notification under Parts 15 or 18 of the Commission's Rules. Our list will also indicate that the facility complies with the radiated and AC line conducted test site criteria in ANSI C63.4-1992. Please note that this filing must be updated for any changes made to the facility, and at least every three years the data on file must be certified as current.

Per your request, the above mentioned facility has been also added to our list of those who perform these measurement services for the public on a fee basis. This list is published periodically and is also available on the Laboratory's Public Access Link as described in the enclosed Public Notice.

Sincerely,

Thomas W. Phillips
Electronics Engineer

CARRIER FREQUENCY FIELD STRENGTH

RESULTS

Handset: Maximum field strength of 5,506 $\mu\text{V/M}$: Channel # 01

Handset: Maximum field strength of 4,410 $\mu\text{V/M}$: Channel # 25

Base Station:

Modes:

Telephone: Maximum field strength of 4,061 $\mu\text{V/M}$: Channel # 01

Telephone: Maximum field strength of 2,557 $\mu\text{V/M}$: Channel # 25

TEST CONDITIONS

Equipment Positioning:

Handset: vertical or upright

Base Station: standing on its back with the antenna extended in the vertical plane.

Antenna Polarization:

Handset: vertical

Base Station: vertical

Antenna Type: T.1; tuned half wave dipole

Measurement Bandwidth: 100 KHz (IF)

Supply Voltages:

Handset: 3.6 VDC from an internal battery.

Base Station: 120 VAC/60 Hz to 15 VDC (adapter)

METHODS OF MEASUREMENT

The cordless phone components were placed in turn on a one metre high, non-metallic turntable. Measurements were made in a minimum of 3 positions for the handset and 2 for the base station. If adjustable, the whip antennas were fully extended.

For each of the above conditions the turntable was rotated through 360 degrees while the receiving antenna, at three (3) metres from the EUT, was varied in height from 1 to 4 metres and set in both planes of polarization to find the maximum signal strength. The unmodulated carrier level was measured using a spectrum analyzer and a substitution signal from an RF generator. The measured level was converted to a field strength using the antenna correction factors and cable losses.

All base station measurements were made with the equipment under test connected to an artificial telephone line network, with 48 VDC applied.

OCCUPIED BANDWIDTH RESULTS

RESULTS

The highest level emission resulting from the modulation process exceeding the specified frequency range of ± 10 KHz (20 KHz) over the carrier frequency was:

Handset:

Unmodulated carrier level: **-35 dB** (30 dB external pad) **Channel # 01**

Unmodulated carrier level: **-36 dB** (30 dB external pad) **Channel # 25**

a) At the maximum frequency deviation at 2,500 Hz: Channel # 01

-74 dB at -12.5 KHz.

b) At the maximum frequency deviation at 2,500 Hz: Channel # 25

-78 dB at +12.5 KHz.

Base Station:

Unmodulated carrier level: **-48 dB** (30 dB external pad) **Channel # 01**

Unmodulated carrier level: **-52 dB** (30 dB external pad) **Channel # 25**

Telephone:

a) At the maximum frequency deviation at 2,500 Hz: Channel # 01

-77 dB at -12.5 KHz.

b) At the maximum frequency deviation at 2,500 Hz: Channel # 25

-81 dB at -12.5 KHz.

METHODS OF MEASUREMENT

Each transmitter was operated in turn under the standard test conditions specified, and at the maximum output power. An external 2,500 Hz audio signal was coupled to the standard input port and adjusted to a level which produced 85% of the measured "Maximum Frequency Deviation". In this case, the base station and the handset modulation in-band emissions, meet the requirements at maximum frequency deviation. Levels for compliance have therefore been evaluated at these levels. Any internal modulation source that normally operates on a continuous basis was disabled.

A portion of the radio frequency power delivered by the transmitter into the standard output termination was coupled to a spectrum analyzer.

If the cordless telephone contained an internal modulation source that normally operates continuously or for more than three (3) seconds, then the above test was also repeated with the external 2,500 Hz disconnected.

Please refer to the attached results.

POWER LINE CONDUCTED EMISSIONS

RESULTS

The largest RF voltages on the AC power lines, over the frequency range of 450 KHz to 30 MHz, was **7.61 μ V (17.63 dB μ V) at 7.20 MHz** from the base station while transmitting and/or receiving. (B side of the line in the telephone mode) Refer to the attached results.

TEST CONDITIONS

<u>Measurement Bandwidth:</u>	9 KHz Q.P. (IF)
<u>AC Test Voltage:</u>	120 VAC (filtered and stabilized)
<u>Mode of Operation:</u>	Telephone

METHODS OF MEASUREMENT

The base station portion of the cordless phone was placed on a wooden table directly above a 50 ohm line impedance stabilization network.(LISN) If adjustable, the whip antenna was fully extended vertically and the AC power attachment cord went directly down to the LISN. The LISN is grounded directly to the floor of the test facility. Excess AC cord was coiled in a figure eight pattern before connecting directly to the 50 micro-henry LISN.

The base station was connected to a simulated 9,000 foot phone line and 48 VDC was applied. The 9,000 foot phone line network was grounded to the nearest AC outlet with a test lead.

A length of low loss RF foam cable was used to couple the RF voltages from the LISN to the spectrum analyzer. The base station transmitter was keyed on by the handset transmitting nearby. All of the RF voltages were recorded and are attached.

The base station was tested in all modes of operation which were applicable to the specific equipment under test. This included operating modes such as "calling/paging", quiescent or receive mode and standard telephone/transmit operation in both the 43/44 MHz and the 46 MHz bands.

If the cordless phone contained an intercom mode of operation, then this test was repeated in that mode. The attached results represent the **worst case results** in each test condition and frequency band.

MODEL: 2-9776(XXXX) - SIDE: A

POWER LINE CONDUCTED EMISSIONS
MODEL: 2-9776(XXXX) - SIDE: B

TRANSMITTER ENVIRONMENTAL TESTS

FREQUENCY TOLERANCE OF CARRIER

MINIMUM PERFORMANCE STANDARD: The stability of the carrier frequency shall be maintained within +0.01 percent over a range of:

- a) Temperature from -20 to +50 degrees Celsius at normal supply voltage;
- b) Voltages that vary from 85 percent to 115 percent of the rated supply voltage at a temperature of +20 degrees Celsius.

TEST RESULTS:

Channel 1:

Handset: The largest deviation from the authorized carrier frequency of 48,760,000 Hz was +965 Hz ± 10 Hz at -20 degrees Celsius and 3.6 VDC. The test limit is ± 4876 Hz.

Base Station: The largest deviation from the authorized carrier frequency of 43,720,000 Hz was +541 Hz ± 10 Hz at -20 degrees Celsius and 120 VAC. This was within the ± 4372 Hz limit.

Channel 25:

Handset: The largest deviation from the authorized carrier frequency of 49,970,000 Hz was +1011 Hz ± 10 Hz at -20 degrees Celsius and 3.6 VDC. The test limit is ± 4997 Hz.

Base Station: The largest deviation from the authorized carrier frequency of 46,970,000 Hz was +598 Hz ± 10 Hz at -20 degrees Celsius and 120 VAC. This was within the ± 4697 Hz limit.

TEST CONDITIONS:

Supply Voltages: 85%, 100% and 115% of 120VAC, $\pm 2\%$

Stabilization Time: 60 minutes

Temperature: -20, -10, 0, +10, +20, +30, +40 and +50, ± 3 degrees Celsius

Modulation: Both transmitters were unmodulated.

METHOD OF MEASUREMENT:

Both the base and handset components were placed individually in a thermal chamber. The frequency was monitored by a spectrum analyzer and recorded at 1 minute intervals.

The base station was powered from a variable AC transformer. The handset battery was disconnected to enable external DC power operation. The antennae of both transmitters were replaced with short lengths of miniature 50 Ω cable fitted with BNC connectors, for shielded connections to the frequency counter.

At +20 degrees Celsius, after the chamber had stabilized for at least 60 minutes and the samples had been turned off for 15 minutes, the transmitters were operated continuously for 5 minutes at each voltage condition. At the temperature extremes, each transmitter was operated for 5 minutes following stabilization. The frequencies were recorded at 1 minute intervals. The temperature was monitored by a thermocouple on the enclosure.

MODEL NO.: 2-9776(XXXX)

DATE: April 16, 1998

BASE FREQ: 46,970,000 Hz

HANDSET FREQ: 49,970,000 Hz

CLEAR CHANNEL DETECTION

Test Procedure

Setup the equipment as per figure 1.

Verification of Base Unit Detector

1. Connect the base unit to an AC source and place the handset in the off hook mode and select channel 3.
2. Using the spectrum analyzer verify the base and handset frequencies are on channel 3 using the RX antenna.
3. Put the handset on hook.
4. Set the signal generator to channel 3 modulated at 1KHz dev., approx. 20KHz, to produce approximately -30dBm to -40dBm on the analyzer from the RX antenna when feeding this signal to the TX antenna several seconds.
5. Turn the handset on and go off hook.
6. Re-measure the base and handset frequencies. They must be other than the initial ones.
7. Busy the resulting frequency and repeat the above steps.

Verification of Handset Unit Detector

1. Connect the base unit to an AC source and place the handset in the off hook mode and select channel 1.
2. Using the spectrum analyzer verify the base and handset frequencies are on channel 1 using the RX antenna.
3. Put the handset on hook.
4. Set the signal generator to channel 1 modulated at 1KHz dev., approx. 20KHz, to produce approximately -30dBm to -40dBm on the analyzer from the RX antenna when feeding this signal to the TX antenna for several seconds.
5. Place the handset off hook.
6. Re-measure the base and handset frequencies. They must be other than the initial ones.
7. Busy the resulting frequency and repeat the above steps.

TESTS RESULTS

Model: 2-9776(XXXX)

Date: April 9, 1998

Base Unit Detector

Step 2 - Check initial channel

43,820,079 Hz
Base

Channel 3

Step 6 - Recheck channel frequencies

44,120,074 Hz
Base

Channel 7

Step 7 - Recheck channel frequencies

44,320,068 Hz
Base

Channel 11

Step 7 - Recheck channel frequencies

44,480,063 Hz
Base

Channel 15

Step 7 - Recheck channel frequencies

46,710,067 Hz
Base

Channel 19

Step 7 - Recheck channel frequencies

46,870,065 Hz
Base

Channel 23

Handset Unit Detector

Step 2 - Check initial channel

48,760,003 Hz
Handset

Channel 1

Step 6 - Recheck channel frequencies

49,019,997 Hz
Handset

Channel 5

Step 7 - Recheck channel frequencies

49,199,992 Hz
Handset

Channel 9

Step 7 - Recheck channel frequencies

49,399,985 Hz
Handset

Channel 13

Step 7 - Recheck channel frequencies

49,844,975 Hz
Handset

Channel 17

Results: Satisfactory

VI. Verify According to the 15.233(b)(2)(i) Requirements

According to 15.233(b)(2)(i), an automatic channel selection mechanism that will prevent establishment of a link on any occupied frequency on channels one through fifteen must be incorporated. The following test method is used to confirm this function:

1. Turn on the EUT and record the frequency of base from the spectrum analyzer.
2. Turn off the EUT.
3. Set the signal generator(HP3325B) to the frequency recorded in step 1.
4. Turn on the EUT again and read the frequency from the spectrum analyzer. If the reading is not same as the frequency recorded in step 1, this means the EUT complies with the requirements.
5. Press the channel select button 25 times and read the frequency every time the button is pressed. If the frequency reading is not same as the frequency recorded in step 1, this means the EUT complies with the requirements.
6. Repeat steps 1-5 for the handset.
7. Repeat steps 1-6 for another frequency pairs.

P/S: The level of the radiated signal generated by signal generator is set to 10dB below, 10dB above and equal to the EUT's radiated level respectively for testing.

RESULT : After three pairs of frequency (channel 1, 8, 15) was verified with the steps mentioned above, no frequency reading is recorded same as the pre-set frequency of signal generator.

P.1

3. CIRCUIT SCHEMATIC AND DESCRIPTION

P. 2 of 2
P15-1

The interface schematic diagram for the telephone is attached as Figure 2. The terminal categories of Section 68.304, categories (1) through (8), are indicated for each point of connection.

A description of all electrical circuitry which affects compliance with Part 68 is given below:

The electrical circuitry is that of a standard telephone instrument. It is composed of a high-impedance ringer in series with a capacitor, a network, a switch hook assembly and a receiver and transmitter.

The device is powered solely from the telephone loop to which it is connected, drawing the normal and permissive off-hook current from the serving central office or private branch exchange, when used with a PBX.

Ring current is received from the central office to cause the internal ringing to signal that a call is to be received. The device produces only human sensory sounds, and if provided with Dual-Tone, Multi-Frequency (DTMF) means of network address signaling such tone below the maximum permissible signal levels.

A typical industry standard drawing is attached showing all active and passive circuit elements. None can cause non-compliance with subpart D of Part 68.

The instrument consists of a baseplate on which elements are mounted and a cover housing. Photographs are attached showing exterior and interior details.
