3.3 RADIATED EMISSION LIMIT

☒ FCC 15.227 Fundamental Emission Limits

Frequency	Distance	Field Strength of Fundamental	
MHz	Meter	$\mu\text{V/m}$	$\text{dB}\mu\text{V/m}$
26.96 – 27.28	3	10,000	80

Remarks :

1. The emission limit is base on measeurement instrumentation employing an average detector.
2. RF Voltage ($\text{dB}\mu\text{V/m}$) = $20 \log \text{RF Voltage } (\mu\text{V/m})$
3. Distance refers to the distance in meters between the measuring instrument antenna and the closed point of any part of the device or system.

☒ General Radiated Emission Limits

The filed strength of any emissions which appear outside of this band (26.96 – 27.28 MHz) shall not exceed the general radisted emission limits in Section 15.209.

Frequency	Distance	Field Strength	
MHz	Meter	$\mu\text{V/m}$	$\text{dB}\mu\text{V/m}$
1.705 to 30	30	30	29.5
30 to 88	3	100	40.0
88 to 216	3	150	43.5
216 to 960	3	200	46.0
Above 960	3	500	54.0

Remarks :

1. RF Voltage ($\text{dB}\mu\text{V/m}$) = $20 \log \text{RF Voltage } (\mu\text{V/m})$
2. In the Above Table, the tighter limit applies at the band edges.
3. Distance refers to the distance in meters between the measuring instrument antenna and the closed point of any part of the device or system.

3.4 EUT CONFIGURATION

The equipment which is listed 2.6 are installed on Radiated Emission Test to meet the Commission requirement and operating in a manner which tends to maximize its emission characteristics in a normal application.

The device under test, installed in a representative system as described in section 4.2, was placed on a non-conductive table whose total height equaled 80 cm. This table can be rotated 360 degree. The measurement antenna was mounted to a non-conductive mast. Antenna height was varied from 1 meter to 4 meters and the system under test was rotated from 0 degree through 360 degrees relative to the antenna position and polarization. Also the I/O cable position was investigated to find the maximum emission condition.

3.5 OPERATING CONDITION OF EUT

Same as section 2.7.

3.6 RADIATED EMISSION DATA

The measurement range of radiated emission, which is from [Fundamental frequency to 1GHz](#), was investigated. All readings below 1GHz are quasi-peak values with a resolution bandwidth of 9kHz for below 30MHz and 120 KHz for 30MHz to 1GHz. The initial step in collecting radiated emission data is a spectrum analyzer peak scans of the measurement range for all the test modes and then use test receiver for final measurement. Then the worst modes were reported the following data pages.
