Spurious Radiated Emissions	FCC 15C ISED RSS-GEN	ANSI C63.10: 2013	Sample 1	Conforms

14. Sample Calculations

For Powerline Conducted Emissions:

The resultant voltage level (VL) is a summation in decibels (dB) of the receiver meter reading (MTR) and the cable loss factor (CF).

$$\text{Formula 1: VL (dBuV) = MTR (dBuV) + CF (dB).}$$

For Radiated Emissions:

The resultant field strength (FS) is a summation in decibels (dB) of the receiver meter reading (MTR), the antenna correction factor (AF), and the cable loss factor (CF). If an external preamplifier is used, the total is reduced by its gain (-PA). If a distance correction (DC) is required, it is added to the total.

$$\text{Formula 1: FS (dBuV/m) = MTR (dBuV) + AF (dB/m) + CF (dB) + (- PA (dB)) + DC (dB)}$$

To convert the Field Strength dBuV/m term to uV/m, the dBuV/m is first divided by 20. The Base 10 AntiLog is taken of this quotient. The result is the Field Strength value in uV/m terms.

$$\text{Formula 2: FS (uV/m) = AntiLog [(FS (dBuV/m))/20]}$$

15. Statement of Conformity

Procedures
The EUT was placed on an 80cm high non-conductive stand. The unit was set to transmit continuously. With an antenna positioned nearby, occupied bandwidth emissions were displayed on the spectrum analyzer. The resolution bandwidth was set to 1% to 5% of the actual occupied bandwidth and span was set to 2MHz. The 99% Power Bandwidth function of the spectrum analyzer was enabled. A screen capture was taken of the frequency spectrum near the carrier using a screen dump function on the spectrum analyzer.

0.009 – 0.490 MHz	2400/F(kHz)	300

88 – 216 MHz	150	3
216 – 960 MHz	200	3
Above 960 MHz	500	3

Procedures
Radiated measurements were performed in a 32ft. x 20ft. x 14ft. high shielded enclosure. The shielded enclosure prevents emissions from other sources, such as radio and TV stations from interfering with the measurements. All powerlines and signal lines entering the enclosure pass through filters on the enclosure wall. The powerline filters prevent extraneous signals from entering the enclosure on these leads. Preliminary radiated emissions tests were performed to determine the emission characteristics of the EUT. For the preliminary test, a broadband measuring antenna was positioned at a 3-meter distance from the EUT. The entire frequency range from 150kHz to 30MHz was investigated using a peak detector function. The final open field emission tests were then manually performed over the frequency range of 150kHz to 30MHz. a) The field strength of the fundamental was measured using a loop antenna. The loop antenna was positioned at a 3-meter distance from the EUT. The EUT was 80cm high non-conductive stand. A quasi-peak detector with a resolution bandwidth of 200Hz was used on the spectrum analyzer. b) To ensure that maximum or worst-case emission levels at the fundamental and harmonics were measured, the following steps were taken when measuring the fundamental emissions and the spurious emissions: i) The EUT was rotated so that all of its sides were exposed to the receiving antenna. When the position that corresponded to the maximum emissions was found, the antenna was spun 90° to further maximize the emissions. ii) Since the measuring antenna is linearly polarized, both horizontal and vertical field components were measured.
