3 EUT description

3.1 General description

The EUT, MCS-700, is an outdoor wireless siren, including a receiver for alarm activation and a transmitter operating at 315 MHz to deliver periodic status message to alarm system. The device is powered from mains via 120 V AC/9 V AC adapter and contains an internal rechargeable back up battery.

3.2 EUT test configuration

The EUT ports and lines description is given in Table 3.2.1, test configuration - in Figure 3.2.1.

*The transmit signal consists of a preamble and a message. The total duration of the preamble is 54.8 msec, the total ON time during the preamble is 38.8 msec

In 100 msec interval the message time is: $100 - 54.8 = 45.2$ (msec),
the message ON time is $45.2 \times 66.667\% = 30.15$ (msec) – Manchester code is used.

Total ON time in 100 msec interval is equal to $38.8 + 30.15 = 68.95$ (msec).

TEST PROCEDURE

The EUT was tested, being placed on a wooden 80 cm height turntable in vertical and horizontal position in turn. To find maximum radiation the turntable was rotated 360°, measuring antenna height was changed from 1 to 4 m, and the antenna polarization was changed from vertical to horizontal.

For full test results refer to Plots A2 to A10.

Emissions found in 30 - 1000 MHz range were due to the contained digital device and are brought in section 4.4 of this test report.

Verdict: Pass

Notes to table:

* Radiated emission value was calculated: peak value + average factor (-3.23 dB)

** In accordance with RSS-210 the restricted band limits were used: 74 dB (μV/m) peak and 54 dB (μV/m) average

RBW: resolution bandwidth; VBW: video bandwidth; TT – turntable.

TEST PROCEDURE

The EUT was tested, being placed on a wooden 80 cm height turntable in vertical and horizontal position in turn.

9 kHz – 30 MHz range. The test was performed in the anechoic chamber. The loop antenna was positioned with its plane vertical. The loop center was 1 meter above the ground plane. To find maximum radiation the turntable was rotated 360° and the measuring antenna was rotated about its vertical axis.

30 MHz – 3.2 GHz range. Preliminary test was performed in anechoic chamber with biconilog antenna in 30 – 1000 MHz range and with double ridged guide antenna in 1000 – 3200 MHz range; the final test was performed at the OATS. To find maximum radiation the turntable was rotated 360°, measuring antenna height was changed from 1 to 4 m, and the antennas polarization was changed from vertical to horizontal.

LIMIT § 15.231 ©

The bandwidth of the emission shall be no wider than 0.25% of the center frequency for devices operating above 70 MHz and below 900 MHz. For devices operating above 900 MHz, the emission shall be no wider than 0.5% of the center frequency. Bandwidth is determined at the points 20 dB down from the modulated carrier.

TEST PROCEDURE

The spectrum trace data around transmitter fundamental frequency was obtained with the spectrum analyzer in "Max Hold" mode. The bandwidth value was determined between two points 20 dB down from the modulated carrier.

TEST PROCEDURE

The measurements were performed at mains terminals by means of LISN, connected to spectrum analyzer in the frequency range as referred to in the table above. The unused coaxial connector of the LISN was terminated with 50 Ω . The measurements were made with quasi-peak and average detectors as referred to in the tables. The position of the EUT cables was varied to determine maximum emission level.

Appendix D - General information

Test facility description

Tests were performed at Hermon Laboratories Ltd., which is a fully independent, private EMC, safety, environmental and telecommunication testing facility. Hermon Laboratories is listed by the Federal Communications Commission (USA) for all parts of Code of Federal Regulations 47 (CFR 47) and by Industry Canada for electromagnetic emissions (file numbers IC 2186-1 for OATS and IC 2186-2 for anechoic chamber), certified by VCCI, Japan (the registration numbers are R-808 for OATS, R-1082 for anechoic chamber, C-845 for conducted emissions site), assessed by TNO Certification EP&S (Netherlands) for a number of EMC, telecommunications, environmental, safety standards, and by AMTAC (UK) for safety of medical devices. The laboratory is accredited by American Association for Laboratory Accreditation (USA) according to ISO/IEC 17025 for electromagnetic compatibility, product safety, telecommunications testing and environmental simulation (for exact scope please refer to Certificate No. 839.01).

Address: PO Box 23, Binyamina 30500, Israel.
Telephone: +972 4628 8001
Fax: +972 4628 8277

Person for contact: Mr. Alex Usoskin, QA manager.

Abbreviations and acronyms

The following abbreviations and acronyms are applicable to this test report:

AC	alternating current
cm	centimeter
dB	decibel
dBm	decibel referred to one milliwatt
dB(μ V)	decibel referred to one microvolt
dB(μ V/m)	decibel referred to one microvolt per meter
EUT	equipment under test
GHz	gigahertz
H	height
Hz	hertz
kHz	kilohertz
kV	kilovolt
L	length
LISN	line impedance stabilization network
m	meter
MHz	megahertz
NA	not applicable
QP	quasi-peak
RF	radio frequency
RE	radiated emission
rms	root mean square
s	second
V	volt
W	width
