Device Under Test Description

Application for	PS 150 AirHost Unit, Single Band Medium Power DAS
Passing Transmit/Receive Frequency ...	130 MHz – 174 MHz
Operating Transmit/Receive Frequency	150.8 MHz – 156.2475 MHz
FCC	157.1875 MHz – 161.575 MHz
	161.775 MHz – 161.9625 MHz
	162. 0375 MHz – 173.4 MHz
Operating Transmit/Receive Frequency	138 MHz – 144 MHz
Industrial Canada	148 MHz – 174 MHz
Number of Channels	As many as which can fit
Rated RF Output(e.i.r.p.).....	37 dBm
Modulation Type	P25 Phase I C4FM, CQPSK; P25 Phase II HCPM
Equipment mobility	Fixed

Operating condition	-40 to +50 °C
Mass of equipment (g).....	< 27,000g
Dimension(W X D X H)	434 mm X 220 mm X 696 mm
Nominal Voltages for:	<u>48 V</u> stand-alone equipment <u>48 V</u> combined (or host) equipment
Supply Voltage:	_____ AC _____ Amps <u>48V</u> DC <u>2.5</u> Amps
If DC Power:	☐ Internal Power Supply ☒ External Power Supply ☐ Battery ☐ Nickel Cadmium ☐ Alkaline ☐ Nickel-Metal Hydride ☐ Lithium-Ion ☐ Other

Program details

Summary of testing:	
Tests performed (name of test and test clause): Conducted Measurement Radiated Emissions on Enclosure	Testing location: Client Site as Witness Testing In SAC, Richmond
The tests indicated in Test Summary were performed on the product constructed as described below. The test sections are the verbatim text from the actual data sheets used during the investigation. These test sections include the test name, the specified test Method, a list of the actual Test Equipment Used, documentation Photos, Results and raw Data. No additions, deviations, or exclusions have been made from the standard(s) unless specifically noted. Based on the results of our investigation, we have concluded the product tested complies with the requirements of the standard(s) indicated. The results obtained in this test report pertain only to the item(s) tested. LabTest does not make any claims of compliance for samples or variants which were not tested.	

Description of Equipment Under Test and Variant Models

Description: The airHost 150PS is a single-band off-air fed host unit. The airhost PS accepts DL analog RF signals from –ff-air donor antenna and transmits UL RF signal back to macro tower at 5 W maximum. The single-band unit supports one band in a type 2 sealed chassis door. On the downlink path the airHost PS translates analog RF content into a digital data stream, and then

transports the data stream to remote units on one to eight optical links, each operating at 10 Gbps. Because radio signal is processed and combined in the digital domain, no passive intermodulation (PIM) is introduced.

On the UL path the airhost PS does the reverse. It receives data stream from the remotes, which are then converted back to analog RF. The signal is filtered and amplified to a composite power of 5 W maximum, and then delivered back to the macro tower through outdoor directional antenna.

The airHost PS also supports 1 Gbps Ethernet backhaul for transporting the data from IP devices such as security cameras and Wi-Fi access points located close to remote units.

The intentional transmitter only exists in the uplink path and hence the EMC tests in this report dedicated to the uplink emission.

In order to build up a complete signal booster system, the hd33 remote unit was connected as the Auxiliary device. The signal was injected and ejected via coaxial cables.

Variant Models:

The following variant models were not tested as part of this evaluation, but have been identified by the manufacturer as being electrically identical models, depopulated models, or with reasonable similarity to the model(s) tested. Intertek does not make any claims of compliance for samples or variants which were not tested.

EUT Operation Modes

Mode #	Description
1	UL and DL transmission and receiving ON

EUT Configuration Modes

Mode #	Description
1	airHost maximum input threshold set to -55 dBm, uplink attenuation set to 0dB; hd33 uplink and downlink attenuation set to 0dB.

Test Equipment Verified for function

Model #	Description	Checked Function	Results
N9038A	Spectrum Analyzer	Frequency and Amplitude	Connected 50MHz and -20 dBm Ref_siganl and checked OK.
JB1	Antenna, 30 to 2000MHz	Checked structure	Normal – no damage.
SAS-571	Antenna, 1 to 18GHz	Checked structure	Normal – no damage.
AL-130	Antenna, 9kHz to 30MHz	Checked structure	Normal – no damage.
KT-N5172B	Signal Generator, up to 6GHz	Frequency, Amplitude and Modulation	Within MFR Specs
KT-N9010A	Spectrum Analyzer	Frquency and Amplitude	Within MFR Specs

Measurement Uncertainty

Where relevant, the following measurement uncertainty levels have been estimated for tests:

Parameter	Uncertainty
Radio Frequency	±1 ppm
Total RF Power: Conducted	±1 dB

RF Power Density: Conducted	±2.75 dB
Spurious Emissions: Conducted	±3 dB
Temperature	±1 °C
Humidity	±5 %
DC and Low Frequency Voltages	±3 %
Radiated Emission, 30 to 6,000MHz	± 4.95 dB

Uncertainty figures are valid to a confidence level of 95%.

Result Summary

The Compliance Status is a judgment based on the direct measurements and calculated highest emissions to appropriate standard limits. Measurement uncertainty values, provided on calibration certificates, were not be used in the judgment of the final status of compliance.

Output Power is less than 37 dBm in band 150. The output total power of active dual channels is compressed to the same level due to the ALC control. Each channel power is accordingly 3 dB down from the total power.			
Compliant ☒ Non-Compliant ☐ Not Applicable ☐			

Test setup

Description of test set-up:

Output power is measured by connecting a spectrum analyzer to RF output connector of EUT via 40dB Attenuator. With a nominal input power and the amplifier properly adjusted the RF output is measured.

The EUT was set to **Operation Mode #1 with configuration Mode #1.**

The maximum output power is measured when the Automatic Level Control (ALC) starting to compress the power and hold to a constant level.

Results – Output Power FCC Requirement and IC Single Channel Requirement

Frequency (MHz)	Input Power Trip ALC (dBm)	Output Power (dBm)	Limit (37dBm)
150.815	-54.5	36.9	PASS
157.47	-55	36.9	PASS
161.79	-55	36.6	PASS
173.39625	-54	36	PASS

Results – Output Power IC Multi-Channel Requirement

The output total power of active dual channels is compressed to the same level due to the ALC control. Each channel power is accordingly 3 dB down from the total power.

At Input Power 0.5dB below AGC threshold, 138.5 MHz

Compliant ☒ Non-Compliant ☐ Not Applicable ☐					

Test setup

Description of test set-up:	
Occupied Bandwidth is measured by connecting a Spectrum Analyzer to the RF output connector via 40dB attenuator. The required measurement resolution bandwidth (RBW) is 1% of the emission bandwidth. 99% energy rule was applied to measure the occupied channel bandwidth. The emission bandwidth is measured as the width of the signal between two frequency points on the channel edge, outside of which the transmission power is attenuated at least 26dB below the transmitter output power The EUT was set to Operation Mode #1 with configuration Mode #1.

Test setup

Description of test set-up:

Unwanted emission was measured by connecting a Spectrum Analyzer to the RF output connector via 40dB Attenuator. The input power was adjusted to produce maximum output power on the antenna port and just below the AGC threshold. The CW input signal was set to the lowest channel, center channel and the highest channel of the EUT operating band.

The EUT was set to **Operation Mode #1 with configuration Mode #1.**

Results

Frequency Stability

The airHost33 and hd33 are synchronized to the same reference clock. Therefore there is no frequency error after down and up frequency conversion are performed.

The frequency stability check is not applicable to the EUT.

Test setup

Description of test set-up:

The procedure used was ANSI/TIA-603-E-2016 and FCC KDB 935210 D05 Indus Booster Basic Meas v01r02. The signal booster was set to maximum gain. A swept CW signal was set to the range of $\pm 250\%$ of the product pass band. The CW amplitude was set to 5 dB below the AGC threshold so that the ALC should not activate throughout the test.

After the max-hold sweep trace was completed, a marker was set to the peak amplitude, and a 20dB bandwidth was measured between two additional markers fall 20 dB from the peak.

The EUT was set to **Operation Mode #1 with configuration Mode #1.**

The intermodulation product of 2 tone is below the -13dBm emission limit with input power - 0.5dBm below AGC threshold and - 3 dB above AGC threshold			
Compliant ☒ Non-Compliant ☐ Not Applicable ☐			

Test setup

Description of test set-up:

The procedure used was ANSI/TIA-603-E-2016. Two tones (CW) method was used. The input power to the amplifier was set at maximum drive level by combining the two tones. The two tones were chosen in such a way (1) the third order intermodulation product frequencies are located within the pass band of the DUT and (2) they produce the worst-case emissions out of band. All signals were modulated.

Based on FCC KDB 935210 D05 Indus Booster Basic Meas v01r02: 2017, the two tone was located on either side of the maximum gain frequency in the passing band, and separated with the available spacing, which is 12.5kHz in 150 MHz band.

Measurements were performed with 2-tone at identical input amplitude which produced integrated maximum rated output power.

The EUT was set to **Operation Mode #1 with configuration Mode #1.**

Results

On the maximum gain channel 155.3 MHz:

At Input Power 0.5 dB below AGC threshold

At Input Power 3 dB above AGC threshold

Input/output Power and Amplifier/Booster Gain

Test setup

Description of test set-up:	
The procedure used was ANSI/TIA-603-E-2016 and FCC KDB 935210 D05 Indus Booster Basic Meas v01r02:. A CW tone was input at the frequency where the system gain is the maximum in the pass band, with the nominal input power level -55 dBm. The spectrum analyzer was connected to the output RF port via a 50 Ohm 40 dB attenuator. The maximum hold trace and peak detector was used to capture the output power. The output power minus the input power (-55 dBm) equals to the booster gain in dB.	
The EUT was set to Operation Mode #1 with configuration Mode #1.

Test setup

Description of test set-up: Based on FCC KDB 935210 D05 Indus Booster Basic Meas v01r02: 2017, the system maximum gain and the noise density is measured. Measurements were performed within the EUT's passband. The noise figure is then calculated by $NF = NP - Gain + KTB \text{ Noise}$; where NP is in band noise power per Herz, Gain is in band booster gain, which is 92 dB in UL. KTB Noise is 174dB/Hz at room temperature. The EUT was set to Operation Mode #1 with configuration Mode #1. For Noise Power Measurement <pre> graph LR SA[Spectrum Analyzer] --- EUT[EUT] EUT --- hd33[hd33] </pre>

Test setup

Description of test set-up:

The EUT was placed on a nonconducting platform (i.e., an "EUT support table"), of nominal size 1 m by 1.5 m, whose top surface is nominally 80 cm above the reference ground plane. The EUT was set up on 3 meters away from the EUT. The EUT was set continually on its Radio, 5W Max., which was [uplinked from hd33](#). And the output of RF was terminated via 40dB attenuator, for rejecting the high power of carrier. The lowest, middle and highest channels were used for measuring of all radiated spurious emissions .

The EUT was set to **Operation Mode #1 with configuration Mode #1**.

- Radiated Emission 30 to 1,000MHz, with JB-1

- Radiated Emission 1 to 18GHz, with SAS-571

Measurement Procedure

Testing was performed in accordance with the test standard(s) referenced in the test summary section of this report. The Equipment Under Test (EUT) was configured based upon the requirements of the applicable test standard. Initially, the primary emission frequencies are identified by positioning a broadband receive antenna three meter from the EUT.

Scans were made with an EMC Analyzer, controlled by EMC Test Software, Tile7!, from 30kHz to 2GHz with the receiver in the peak mode. The receiver IF bandwidth was 9kHz, 120 kHz or 1MHz as appropriate for the frequency and scan step was about 30kHz. To ensure that the maximum emission at each discrete frequency of interest is observed, the receive antenna is varied in height from one to four meters and rotated to produce horizontal and vertical polarities while the turntable is rotated to determine the worst emitting configuration. Under 30MHz was only tested at 1meter height and Antenna was changed both polarization, Horizontal and Vertical. Measurements were then made using CISPR quasi peak when the peak readings were within 10dB of the limit line. The numerical results are included herein to demonstrate compliance.

Test Result

The output of EUT was set to 5 Watt(+37dBm),
The PASS level of Spurious is: $43 + 10\log(P) = 43 + 10\log(1) = 49.99\text{dB}$ attenuation = -13dBm

Since of radiated measurement was performed at 3 meters, the limit line was converted to dBuV/m using the formulas as outlined in KDB 971168 (5.8.4): -13 dBm ERP = 84.38 dBuV/m at 3 meters.

Spurious Emission level (dBuV/m) = Detected level (dBuV) + Path Loss(dB) + Antenna Factor (dB/m) - Preamplifier's Gain (dB)

Graphical Representation for Emission - Radiated 30kHz to 30MHz

Spectrum was scanned manually from 30kHz to 30MHz. No automated plot is available for this frequency range. No spurious emissions from the product were detectable

Graphical Representation for Emission - Radiated 30MHz to 1GHz

Graphical Representation for Emission - Radiated 1 to 18GHz

APPENDIX A: ISO 17025:2005 Accreditation Certificate

CERTIFICATE OF ACCREDITATION

ANSI-ASQ National Accreditation Board

500 Montgomery Street, Suite 625, Alexandria, VA 22314, 877-344-3044

This is to certify that

Labtest Certification, Inc.
