General product information:

The EUT, Dali's t30SNI1NB, (30 dBm, 1 W) is an all-digital, low power, single-band radio remote. It bi-directionally transfers 800 MHz public safety bands over a single optical fiber (SFP –Single Mode Fiber) to/from the tHost® at 6 Gb/s up to 40 km. It also accommodates 1Gb/s Ethernet backhaul as well. This smart radio remote enables multiple network topologies that cater to different deployments scenarios including star, chain, hybrid and loop topologies.

ARRANGEMENT OF INTERFACE CABLES: All interface cables were positioned for worst-case maximum emissions within the manner assumed to be a typical operation condition (please reference photographs).

Software and Firmware

Description	Version
NMS_monitoring for HOST and REMOTE	1.9.0RC10.9

Worst-case configuration and mode of operation during testing

The EUT was connected to HOST, t30 via Fiber Optic cable and kept sending out downlinked radio, 1W Max.

Modifications Required for Compliance

To reduce the radiated emissions, some ferrites were installed AUX and DC In Cables as see below photos.

Test Equipment Verified for function

Model #	Description	Checked Function	Results

Onset HOBO	Humidity/ Temperature Logger	Compared room Temp. and Hum. with another data logger	Working normally

Measurement Uncertainty

Where relevant, the following measurement uncertainty levels have been estimated for tests:

Parameter	Uncertainty(dB)
Radiated Emission, 30 to 1,000MHz	4.67
Radiated Emission, 1 to 18GHz	4.65

Uncertainty figures are valid to a confidence level of 95%.

Markings

You should refer to the clause of FCC Part 2 Section 2.295 & 2.296 and FCC Part 15 Section 15.19 for information to be contained on the label as well as information about the label. Any other statements or labelling requirements may appear on a separate label at the option of the applicant/grantee. The label has to be including FCC IC/IC ID, Product Number and Manufacturer Info.

According to FCC Section 2.925(a),

(a) Each equipment covered in an application for equipment authorization shall bear a nameplate or label listing the following:

(1) FCC Identifier consisting of the two elements in the exact order specified in §2.926. The FCC Identifier shall be preceded by the term *FCC ID* in capital letters on a single line, and shall be a type size large enough to be legible without the aid of magnification.

Example: FCC ID XXX123. XXX-Grantee Code 123-Equipment Product Code"

Test Summary

When configured and operated as specified in this report, the product was found to comply with the requirements as indicated below.

Test Limits

FCC §2.1053 Measurements required: Field strength of spurious radiation.

(a) Measurements shall be made to detect spurious emissions that may be radiated directly from the cabinet, control circuits, power leads, or intermediate circuit elements under normal conditions of installation and operation. Curves or equivalent data shall be supplied showing the magnitude of each harmonic and other spurious emission. For this test, single sideband, independent sideband, and controlled carrier transmitters shall be modulated under the conditions specified in paragraph (c) of §2.1049, as appropriate.

FCC §90.210 Emission masks.

(g) Emission Mask G. For transmitters that are not equipped with an audio low-pass filter, the power of any emission must be attenuated below the unmodulated carrier power (P) as follows:

(2) On any frequency removed from the center of the authorized bandwidth by more than 250 percent of the authorized bandwidth: At least $43 + 10 \log (P)$ dB.

FCC §90.219 Use of signal boosters.

(e) Device Specifications. In addition to the general rules for equipment certification in §90.203(a)(2) and part 2, subpart J of this chapter, a signal booster must also meet the rules in this paragraph.

(3) Spurious emissions from a signal booster must not exceed -13 dBm within any 100 kHz measurement bandwidth.

Test Setup

The test was performed in accordance with **ANSI/TIA-603-C-2004**.

The test setup for Field Strength of Spurious is shown in Figure - 1.

- The EUT was placed on a wooden Table and it was put on the turning ground plate in Chamber.
- The EUT was set up on 3 meters away from the EUT.
- The EUT was set continually on its Radio, 1W Max., which was downlinked from tHOST. And the output of RF was terminated via 40dB attenuator, for rejecting the high power of carrier.
- The lowest, middle and highest channels were used for measuring of all radiated spurious emissions .
- It was measured with a receiver - spectrum analyzer, Antenna and pre-amplifier, was software controlled.

Test Results:

The output of EUT was set to 1 Watt(+30dBm), the PASS level of Spurious is:

$$43 + 10\log(P) = 43 + 10\log(1) = 43\text{dB attenuation} = -13\text{dBm}$$

Since of radiated measurement was performed at 3 meters, the limit line was converted to dBuV/m using the formulas ad outlined in KDB 971168:

$$-13 \text{ dBm ERP} = 84.38 \text{ dBuV/m at 3 meters.}$$

Spurious Emission level (dBuV/m) = Detected level (dBuV) + Path Loss(dB) + Antenna Factor (dB/m) - Pre-amplifier's Gain (dB)

X **Pass** **Fail** **N/A**

**There was no radiated spurious emissions were detected between 9 kHz to 30MHz.
And all Spurious Emissions from 30MHz to 10GHz were below the limit value, 84.38dBuV/m.**
