ENGINEERING TEST REPORT**7. NOISE FIGURE MEASUREMENT****7.1 Reference Rule and Specification**

FCC Rule Part 15, Section 15.117(g).

7.2 Test Procedure

- 1) Configure the EUT system in accordance with FCC/OET MP-2, and 7.3 Test Configuration in this report.
- 2) Active and warm up the EUT system.
- 3) Connect the antenna input terminal of EUT to the correct terminating impedance.
- 4) Measurement of AGC voltage of EUT are made at the measurement channels.
- 5) Connect the antenna input terminal of EUT to the Noise Source of the Noise Figure Indicator(*1) by using the matching transformer, the noise source and coaxial cable. Connect the intermediate frequency terminal on the tuner pack of EUT to the IF INPUT terminal of the Noise Figure Indicator by using the coaxial cable.
- 6) In final compliance test, the measurement are performed at all US UHF channel by using the noise figure indicator.
- 7) If ΔF (Noise Figure contribution of the amplifier following the measurement point in dB) exceed 0.3 dB, the measured noise figure is corrected by ΔF . ΔF is calculated the tuner gain(gain of circuit from receiver antenna input terminal to measurement point as a power), the noise figure from receiver antenna input terminal to measurement point as power ratio and the noise figure of that IF amplifier as power ratio, therefore the tuner gain shall be measured.
- 8) For the measurement of the tuner gain, Connect the intermediate frequency terminal on the tuner pack of EUT to the spectrum analyzer(*2) by using the high impedance probe and connect the antenna input terminal of EUT to the standard signal generator by using the matching transformer and the coaxial cable.
- 9) The frequency of the standard signal generator is adjusted the tuned frequency of EUT.
- 10) Then, tuner gain is calculated as that the ratio of the output level of intermediate frequency amplifier on the tuner pack of EUT appeared on the spectrum analyzer minus the output level of the standard signal generator and ΔF is calculated.

- ① Playback mode
Playback the video tape that is recorded 1V peak-to-peak VITS signal.
- ② Record mode (1V VITS Signal Input)
1V peak-to-peak VITS signal is supplied through the VIDEO IN 1(rear side) terminal.
- ③ Record mode (5V VITS Signal Input)
5V peak-to-peak VITS signal is supplied through the VIDEO IN 1(rear side) terminal.
- ④ Record mode (0 dBmV NTSC TV Signal Input)
NTSC TV U.S. channel 13 video and audio signal is supplied through the ANTENNA IN terminal.

[Note]

Video Signal (0 dBmV at 211.25 MHz) is modulated by 1V peak-to-peak VITS signal.
Audio Signal (-10 dBmV at 215.75 MHz) is not modulated.

- ⑤ Record mode (25 dBmV NTSC TV Signal Input)
NTSC TV U.S. channel 13 video and audio signal is supplied through the ANTENNA IN terminal.

[Note]

Video Signal (25 dBmV at 211.25 MHz) is modulated by 1V peak-to-peak VITS signal.
Audio Signal (15 dBmV at 215.75 MHz) is not modulated.

In each mode, the spectrum was checked and the data of the maximum EUT operation was reported.

4.2 Test Procedure

- 1) Configure the EUT System in accordance with ANSI C63.4-1992 section 8.
See also the block diagram and the photographs of EUT System configuration in this report.
- 2) If the EUT system is connected to a public power network, all power cords for the EUT System are connected the receptacle on the turn floor.
- 3) Warm up the EUT System.
- 4) Activate the EUT System and run the prepared software for the test, if require.
- 5) To find out the emissions of the EUT System, preliminary radiated measurement are performed at a closer distance than that specified for final radiated measurement using the spectrum analyzer(*1) or the spectrum monitor receiver(*2), and the broad band antenna.
- 6) To find out an EUT System condition produces the maximum emission, change the position of the cables, and the EUT operation mode under normal usage of the EUT.
- 7) The spectrum are scanned from 30 MHz to 1 GHz and collect the minimum six highest emissions on the spectrum analyzer relative to the total limits.
- 8) In final compliance test, the minimum six highest emissions recorded above are measured at the specified distance using the broad band antenna or the tuned dipole antenna and the test receiver(*3).
