

EMISSION TEST REPORT

Test Report No. : **22AE0084-YW-1**

Applicant: DENSO CORPORATION

Type of Equipment: Keyless Entry System (Transmitter)

Model No.: 12BBM

FCC ID HYQ12BBM

Test standard: FCC Part 15 Subpart C Section 15.231

Test Result: Complied

This report may not be reproduced in full, partial reproduction may only be made with the written consent of the laboratory.

The results in this report apply only to the sample tested.

Date of test: August 31, 2001

Tested by:

Makoto Kosaka

Approved by:

Kazutoyo Nakanishi

Site Operation Manager of EMC Section

Issued date: September 7, 2001

Revised date: December 6, 2001

Model: 12BBM(referred to as the EUT in this report) is a Keyless Entry System (Transmitter).

The specification is as following :

Carrier Frequency : 314.35 MHz
Modulation : FSK
Other Clock Frequency : 1MHz
Information antenna : P.C.B pattern antenna
Operation Voltage : Lithium Battery DC 3.0V(CR2025)

1.2 Test Specification

Test Specification : FCC Part 15 Subpart C

Title : FCC 47CFR Part15 Radio Frequency Device

Subpart C Intentional Radiators

Section 15.231 Periodic operation in the band 40.66 – 40.70 MHz and above 70MHz

1.3 Methods & Procedures

No.	Item	Test Procedure	Specification	Remarks
1	Electric Field Strength of Fundamental Emission	ANSI C63.4:1992	Section 15.231	3m
2	Electric Field Strength of Spurious Emission	ANSI C63.4:1992	Section 15.205 Section 15.209 Section 15.231	3m
3	-20dB Bandwidth	ANSI C63.4:1992	Section 15.231	3m

1.4 Test Location

2 SYSTEM TEST CONFIGURATION

2.1 Operation Environment

Temperature : See data

Humidity : See data

2.2 Justification

The system was configured in typical fashion (as a customer would normally use it) for testing.

2.3 EUT Exercise Software

The EUT exercise program used during radiated testing was designed to exercise the various system components in a manner similar to typical use.

The sequence is used:

Operation Mode : Transmitting

2.4 Test Procedure

Tabletop Equipment Radiated Emissions

EUT was placed on a platform of nominal size, 1m by 1m, raised 80cm above the conducting ground plane.

Test was made with the antenna positioned in both the horizontal and vertical planes of polarization.

The measurement antenna was varied in height above the conducting ground plane to obtain the maximum signal strength.

The measurement distance was 3m.

Preliminary Radiated Emissions Tests were performed before Final Radiated Emissions Measurements as follows;

-The noise was measured at each position of all three axes X, Y and Z to compare the level, and the maximum noise occurred at the position showed in the photograph.

-The relative measurements were performed on the fundamental and the spurious emissions with each condition of the key folded and the key set up. The key set-up condition was worse case under both the fundamental and the spurious emissions, we, therefore, tested while the key was set up. See the photograph.

3 RADIATED EMISSION DATA

The initial step in collecting radiated data was a spectrum analyzer peak scan of the measurement range (30MHz-3200MHz).

No	Ant Pol	Freq [MHz]	Reading [dBuV]	Antena Facter [dB]	Cable Loss [dB]	ATT [dB]	AMP Gain [dB]	Result [dBuV/m]	Limit [dBuV/m]	Margin [dB]	Remark
1	H	314.36	77.3	14.4	3.6	5.8	27.6	73.5	75.6	2.1	Fundamental
2	H	628.71	39.4	19.3	5.4	5.9	27.3	42.7	55.6	12.9	Spurious

Remark:

Below 1GHz: Test Receiver Setting : QP Detect / IF Band width 120kHz

3.1 Field Strength Calculation

The field strength is calculated by adding the Antenna Factor, Cable Factor and Antenna Pad, and subtracting the Amplifier Gain from the measured reading. The sample calculation is as follows :

$$FS = RA + AF + CF + AT - AG$$

where FS = Field Strength

RA = Receiver Amplitude

AF = Antenna Factor

CF = Cable Factor

AT = Antenna Pad

AG = Amplifier Gain

Assume a receiver reading of 77.3 dBuV is obtained. The antenna Factor of 14.4 dB, Cable Factor of 3.6 dB and Antenna Pad of 5.8 dB is added. The Amplifier Gain of 27.6 dB is subtracted, giving a field strength of 73.5 dBuV/m.

$$FS = 77.3 + 14.4 + 3.6 + 5.8 - 27.6 = 73.5 \text{ dBuV/m}$$

3.2 -20dB Bandwidth

Bandwidth Limit: Fundamental Frequency 314.35MHz x 0.25% = 785.875kHz

Bandwidth Limit	measurement data (20dB down) Center Freq: 314.301MHz	Result
Upper frequency Limit (314.7429375MHz:392.9375kHz)	314.525MHz(224kHz)	Pass
Lower frequency Limit (313.9570625MHz:392.9375kHz)	314.094MHz(207kHz)	Pass
-20dB Bandwidth (785.875kHz)	Uf + Lf = 431kHz	Pass

* See Appendix A2 and A3

3.3 Measurement Uncertainty

Radiated Emission Test

■ Measurement distance of 3m (30-1000MHz):

The measurement uncertainty (with a 95% confidence level) for this test using Biconical antenna is $\pm 4.4\text{dB}$.

The measurement uncertainty (with a 95% confidence level) for this test using Logperiodic antenna is $\pm 3.2\text{dB}$.

■ The data listed in this test report may exceed the test limit because it does not have enough margin.

□ The data listed in this test report has enough margin, more than site margin.

■ Measurement distance of 3m (1000-3200MHz):

The measurement uncertainty (with a 95% confidence level) for this test using Horn antenna is $\pm 5.8\text{dB}$.

□ The data listed in this test report may exceed the test limit because it does not have enough margin.

■ The data listed in this test report has enough margin, more than site margin.
