1.4 Application details

Date of receipt of application : 2006-08-03
Date of receipt of test item : 2006-08-07
Date of test : 2006-08-07 and 2006-08-10

1.5 Test item (EUT)

Description of EUT : 76 GHz millimeter-wave radar sensor
System designation : Automatic cruise control system
Type designation : DNMWR003
Manufacturer : Denso Corporation
Street : 1-1, Showa-cho, Kariya-shi
Town : Aichi-ken, 448-8661
: Japan

1.6 Technical data

Frequency range : 76.000 GHz ... 77.000 GHz
Operational frequency : 76.425 GHz
EIRP PEP : 1.12 W Peak (30.5 dBm Peak)
: 0.132 W AV (21.2 dBm AV)
Type of modulation : 401MF0N
Pulse spacing : 100.0 ms
Pulse width : 11.7 ms (see timing diagram, page 15)
Microwave modules : TX / RX – Module-integrated fixed antennas
Normal DC power supply : 12.0 V
Extreme DC power supply : 10.8 V ... 15.6 V

1.6.1 Operation conditions

Operation : As soon as the equipment is powered up, TX and RX start operating. The system is remote controlled by a control unit. If the velocity of car is 0 km/h, the RF-part is deactivated, no RF is radiated.

Purpose of operation : Automatic distance measurement and cruise control for vehicle application

1.6.2 Equipment under test

Model	S/N	I/F-Box	PC as controller
DNMWR003	001	serial-bus	

1.6.3 Test Report Cover Sheet / Performance Test Data

Equipment Model Number:	DNMWR003
Certification Number:	1551A-DNMWR003
Manufacturer:	Denso Corporation 1-1, Showa-cho, Kariya-shi Aichi-ken, 448-8661 Japan
Tested to Radio Standards Specification (RSS) No.:	RSS210 Issue 6
Open Area Test Site Industry Canada Number:	3463
Frequency Range (or fixed frequency):	76.000 – 77.000 GHz
Power Density:	0.992 $\mu\text{W}/\text{cm}^2$ (Peak) @ 3m
Occupied Bandwidth (99% BW):	401.0 MHz
Type of Modulation:	FM CW
Emission Designator (TRC-43):	401MF0N
Transmitter Spurious (worst case):	< 500 $\mu\text{V}/\text{m}$ @ 3m
Receiver Spurious (worst case):	Not applicable
Antenna Type:	Fixed antenna

ATTESTATION:

DECLARATION OF COMPLIANCE: I declare that the testing was performed or supervised by me; that the test measurements were made in accordance with the above-mentioned Industry Canada standard(s); and that the equipment identified in this application has been subjected to all the applicable test conditions specified in the Industry Canada standards and all of the requirements of the standard have been met.

2 Technical test

2.1 Summary of test results

- ☒ No deviations from the technical specification (s) were ascertained in the course of the performed tests.
- ☐ The deviations as specified in 2.5 were ascertained in the course of the performed tests.

This test report:

- ☒ describes the first test
- ☐ describes an additional test
- ☐ is a verification of documents
- ☐ is only valid with the test report no.

2.2 Test environment

The environmental conditions are documented especially for each test.

2.3 Measurement and test set-up

The measurement and test set-up is defined in the technical specification .

2.4 Test equipment utilized and test set-up

2.4.1 Test set-up for the measurement in the frequency range 12 GHz to 26 GHz

Spurious radiation (EIRP; PEP)

Frequency f (GHz)	Measurement distance (m)	a(sys) [dB]	a(f) [dB]	a(k) [dB]	g [dBi]

2.5 Test results

2.5.1 Test results overview

This test was performed:

☐ in addition to the test report no.

Verification of EUT:

☒ EUT is in accordance with the technical description

☐ EUT is not in accordance with the technical description

☒ The equipment is compliant to FCC requirement

2.5.2 Remarks on methods of measurements

The Radar head is positioned in a non-conductive fixture and can be rotated and tilted in all angles.

The radiated measurements are performed in vertical and horizontal plane in the frequency range from 9 kHz to 325 GHz in a semi-anechoic chamber, a fully-anechoic chamber and in our lab. The EUT is positioned on a non-conductive support with a height of 0.80 m above a conductive ground plane that covers the whole chamber. The receiving antennas conform with specifications ANSI C63.2-1996 clause 15 and ANSI C63.4-2003 clause 4.1.5. These antennas can be moved over the height range between 1.0 m and 4.0 m in order to search for maximum field strength emitted from EUT. The measurement distances between EUT and receiving antennas are indicated in the test set-ups for the various frequency ranges. For each measurement, the EUT is rotated in all three axes until the maximum field strength is received.

The wanted and unwanted emissions are received by spectrum analysers where the detector modes and resolution bandwidths (RBW) over various frequency ranges are set according to requirement ANSI C63.4-2003 clause 4.2.

1. Measurements of the EIRP and power density (PD) at fundamental frequency

The measurements are carried out according to FCC guideline "Millimeter Wave Test Procedure" with a spectrum analyser (SA), harmonic mixer with appropriate frequency range and a rectangular standard gain horn antenna (SGH) with matching wave guide dimensions. The conversion loss of the external mixer is taken into account in the SA power level reading automatically.

The radiated power measurements are performed with resolution bandwidth filter (RBW) of 1.0 MHz and a video filter of 1 MHz. This filter setting is sufficiently broad enough to receive the peak envelope power (PEP) of the EUT. Tests are also performed with RBW 10.0 and Video bandwidth filter (VBW) 7.0 MHz. The received EIRP does not change when RBW and VBW are set to higher values.

The distance for fundamental power measurement generally is 3.0 m. The SA level scale shows the dimension dBm. With a SGH and a measured antenna aperture area the power density can be calculated from the equation:

$$\begin{array}{lclclcl} \text{Power density} & = & \text{EIRP} & / & \text{Antenna aperture area} & [\text{mW/cm}^2] \\ \text{pd} & = & \text{eirp} & - & a & [\text{dB(mW/cm}^2)] \end{array}$$

2. Measurements of frequency stability

In order to measure the frequency stability of the EUT under normal and extreme test conditions, it is necessary to use a smaller RBW filter (here 100 kHz or 300 kHz) so that the spectral lines of the modulated signal are displayed correctly in frequency domain. This setting allows to read the occupied bandwidth and the peak frequency deviation value directly.

Frequency measurements are performed under normal test conditions (normal power supply voltage and normal temperature).

Then the test is repeated with extreme test conditions. For extreme test conditions the EUT is placed in a climatic chamber where the front door is made of stable polystyrene. The EUT can radiate through the front door without any additional path losses. The climatic chamber together with the EUT is cooled down to -20 °C for 1 hour. Then frequency and power density measurements are carried out with power supply set to minimum and maximum values.

The climatic chamber together with the EUT is warmed up at a rate of + 1°C/minute. During warming-up time the frequency stability and the EIRP is monitored constantly. After 2 hours the temperature stability at 55 °C is reached. Then frequency and power density measurements are carried out with minimum and maximum power supply.

3. Measurements of field strength and power density at spurious frequencies

Spurious frequencies are produced by transmitter and receiver when the EUT is active (vehicle is moving). When the EUT is in Not-in-motion-mode, the emissions of the TX has to be reduced more than 25 dB. According to FCC requirements 15.209 and 15.253, spurious emissions have to be investigated as maximum field strength values in the frequency range from 9 kHz to 40 GHz, and as maximum power density in the frequency range > 40 GHz up to 231 GHz. Where possible, the measurement distance shall be 3 m.

In the low frequency range (9 kHz to 30 MHz), the receiving antenna is an active loop antenna which is positioned at 3 m distance in a shielded, anechoic chamber (see page 8). In case of required measuring distances > 3 m, a distance correction factor is used to calculate the received field strength.

Spurious field strength measurements in the frequency range 30 MHz to 12 GHz are carried out in a shielded semi-anechoic test chamber. The measurement distance is 3 m.

In the frequency range 12 GHz to 40 GHz, spurious field strength measurements are performed in a shielded fully anechoic chamber with rectangular SGHs. The measurement distances are indicated underneath each plot, and a calculation for field strength is added, where all relevant factors like cable losses, antenna factors, etc are taken into account.

In the frequency range 40 GHz to 231 GHz, spurious frequencies are measured as power densities. For further remarks see section 1.). The RBW and VBW are set to such a value that spurious power levels are clearly readable above the fundamental noise level of spectrum analyzer.

4. Measurements of maximum safe level for radiated power density

According to FCC § 1.1307, 1.1310, 2.1091, and 2.1093 and also according to ETSI/EN 301 091 measurements are carried out in order to evaluate the impact of human exposure to RF radiation. For this test the EUT is in normal operation mode.

The measurements are applicable only for far field conditions. The near field area extends to a distance of R (meters) and can be calculated from the following equation:

$$R < 2 * L^2 / \lambda$$

with R = distance in meters, L = largest dimension of either receiving or transmitting horn antenna (L = 0.02 m), and λ = wavelength in meters. In case of 76 GHz (λ = 0.0039 m), the far field starts at R > 0.205 m.

The peak power density is measured in 3 m distance as 0.992 $\mu\text{W}/\text{cm}^2$.

Peak Power (EIRP)

$$\begin{aligned} \text{EIRP} &= \text{PD} * 4\pi * R^2 \\ \text{EIRP} &= 1.12 \text{ W (30.5 dBm)} \end{aligned}$$

As the sample works with switched CWFM-modulation there is a difference between peak and average value of the output power.

DENSO

The Duty Cycle

Millimeter Radar Sensor (DNMWR003)

As the output is switched on/off with 11.7 % duty cycle, we have a correction factor of -9.3 dB.

So the average result is 21.2 dBm = 0.132 Watt

Limit of maximum ERP for frequencies above 1.5 GHz is 3 W. See FCC § 2.1091 (EIRP = 4.91 Watt)

RF Exposure for mobile conditions at **R = 20 cm** distance from EUT

$$\begin{aligned} PD &= EIRP / (4\pi * R^2) \\ PD &= 0.026 \text{ mW/cm}^2 \end{aligned}$$

Limit of maximum permissible exposure (MPE) for uncontrolled environment: 1.0 mW/cm². See FCC § 1.1310.

2.5.4 Not-In-motion Mode

SECTION 15.253 (b) (1)

To show compliance with the requirements of Part 15.253 (b) (1) – Not-In-Motion mode, we tested with a serial -bus interface on a laptop with special software to simulate moving or not-moving of the car.

Description of the test:

We placed the antenna 25 cm in front of the radar equipment with vertical polarisation to obtain max. power.
We started the simulation on the PC.

First we set the normal mode, set the analyzer on ch.1 max hold (blue curve) and switched to the second channel.(black curve).

Here we switched the simulation to TX/RX Off mode (not in motion simulation).

The difference is > 45 dB. So the product fulfils the requirements.

Transmitted Power / Antenna Vertical (relative measurement, not optimized for maximum power)

The measured difference between in-motion and not-in-motion is ~ 45 dB.

Power of *in-motion* is approximately -30 dBm/cm² in 3 m measurement distance.
 Power of *not-in motion* is maximum -75 dBm/cm² in 3 m measurement distance (noise floor).
 So the sample fulfils the requirements.

Summary:

Frequency range [GHz]	Measurement distance [m]	In-motion [dBm/cm ²]	Not-in-motion [dBm/cm ²]	Delta [dB]
76.0 – 77.0	3.0	-30.0	-75.0	45.0

LIMITS:

SECTION 15.253 (B) (1)

Frequency range [GHz]	Measurement distance [m]	In-motion	Not-in-motion	Delta [dB]
76.0 – 77.0	3.0	-12.2 dBm/cm ²	-37.0 dBm/cm ²	24.8
		60 μ W/cm ²	200 nW/cm ²	

Verdict: pass

3 Plots, graphs and data sheets

Plot 1

Measurement distance $d = 0.5 \text{ m}$

Calculation: Power density $= \text{EIRP (mW)} / 4 \cdot \pi \cdot 300\text{cm} \cdot 300\text{cm}$

Calculation of system attenuation $= \text{free space attenuation} - \text{antenna gain}$

$a(\text{sys}) = 64.1 \text{ dB} - 18.5 \text{ dB}$
 $= 45.6 \text{ dB}$

Output power $= -15.1 \text{ dBm} + 45.6 \text{ dB} = 30.5 \text{ dBm} = 1122 \text{ mW (Peak)}$
 $= 1122 \text{ mW (30.5 dBm)} / 1130973.4 \text{ cm}^2$

Power density $= 0.992 \text{ } \mu\text{W/cm}^2 \text{ at } 3.0 \text{ m}$

Limit $= 60 \mu\text{W/ cm}^2 \text{ at } 3.0 \text{ m}$

Verdict:	pass
----------	------

Plot 2

Radiated emissions 9 kHz to 30 MHz

RBW/VBW: 200 Hz up to 150 kHz,
 9 kHz up to 30 MHz,
 120 kHz up to 1 GHz

Verdict: pass

Plot 3

Radiated emissions 30 MHz to 4 GHz

RBW/VBW: 200 Hz up to 150 kHz,
 9 kHz up to 30 MHz,
 120 kHz up to 1 GHz,
 1 MHz above 1 GHz

Verdict:	pass
----------	------

Plot 4

Radiated emissions 4 GHz to 12 GHz

RBW/VBW: 200 Hz up to 150 kHz,
 9 kHz up to 30 MHz,
 120 kHz up to 1 GHz,
 1 MHz above 1 GHz

Verdict:	pass
----------	------

Plot 5

Radiated emissions 12 GHz to 18 GHz

Measurement distance $d = 0.5 \text{ m}$

Calculation of system attenuation = free space attenuation + cable loss - antenna gain - dist. correction

$$a(\text{sys}) = a(f) + a(k) - g - dc$$

= 19.3 dB

The system attenuation is calculated in the analyser reading.

Field strength = 27.8 dB μ V/m at 3.0 m

Verdict:	pass
----------	------

Plot 6

Radiated emissions 18 GHz to 26 GHz

Measurement distance d = 0.5 m

Calculation of system attenuation = free space attenuation + cable loss - antenna gain – dist. correction

a(sys) = a(f) + a(k) - g - dc

 = 22.7 dB

The system attenuation is calculated in the analyser reading.

Field strength = 31.3 dB μ V/m at 3.0 m

Verdict:	pass
----------	------

Plot 7

Radiated emissions 26 GHz to 40 GHz

Measurement distance d = 0.25 m

Calculation of system attenuation = free space attenuation + cable loss - antenna gain – dist. correction
a(sys) = a(f) + a(k) - g - dc
 = 14.5 dB

The system attenuation is calculated in the analyser reading.

Field strength = 31.5 dBµV/m at 3.0 m

Verdict:	pass
----------	------

Plot 8

Radiated emissions 40 GHz to 60 GHz

Measurement distance d = 0.25 m

Calculation of system attenuation = free space attenuation - antenna gain
 $a(\text{sys}) = a(f) - g$
 = 28.0 dB

The system attenuation is calculated in the analyser reading.

max. value = -49.6 dBm

Limit at 3m = $600 \text{ pW/cm}^2 = -1.7 \text{ dBm}$ at the DUT

Verdict: pass

Plot 9

Radiated emissions 60 GHz to 76 GHz

Measurement distance $d = 0.125 \text{ m}$

Calculation of system attenuation = free space attenuation - antenna gain
 $a(\text{sys}) = a(f) - g$
 $= 27.0 \text{ dB}$

The system attenuation is calculated in the analyser reading.

max. value = -31.5 dBm

Limit at 3m = $600 \text{ pW/cm}^2 = -1.7 \text{ dBm}$ at the DUT

Verdict: pass

Plot 10

Radiated emissions 77 GHz to 90 GHz

Measurement distance $d = 0.125 \text{ m}$

Calculation of system attenuation = free space attenuation - antenna gain
 $a(\text{sys}) = a(f) - g$
 $= 27.0 \text{ dB}$

The system attenuation is calculated in the analyser reading.

max. value = -33.6 dBm

Limit at 3m = $600 \text{ pW/cm}^2 = -1.7 \text{ dBm}$ at the DUT

Verdict: pass

Plot 11

Radiated emissions 90 GHz to 140 GHz

For this measurement we used a small filter to increase dynamic range.

Measurement distance $d = 0.125 \text{ m}$

Calculation of system attenuation = free space attenuation - antenna gain
 $a(\text{sys}) = a(f) - g$
 $= 29.0 \text{ dB}$

The system attenuation is calculated in the analyser reading.

max. value = -31.2 dBm

Limit at 3m = $600 \text{ pW/cm}^2 = -1.7 \text{ dBm}$ at the DUT

Verdict:	pass
----------	------

Plot 12

Radiated emissions 140 GHz to 170 GHz

For this measurement we used a small filter to increase dynamic range.

Measurement distance $d = 0.125 \text{ m}$

Calculation of system attenuation = free space attenuation - antenna gain
 $a(\text{sys}) = a(f) - g$
 $= 31.0 \text{ dB}$

The system attenuation is calculated in the analyser reading.

max. value = -26.4 dBm

Limit at 3m = $600 \text{ pW/cm}^2 = -1.7 \text{ dBm}$ at the DUT

Verdict: pass

Plot 13

Radiated emissions 170 GHz to 260 GHz

For this measurement we used a small filter to increase dynamic range.

Measurement distance $d = 0.125 \text{ m}$

Calculation of system attenuation = free space attenuation - antenna gain
 $a(\text{sys}) = a(f) - g$
 $= 34.5 \text{ dB}$

The system attenuation is calculated in the analyser reading.

max. value = -24.1 dBm

Limit at 3m (170.0 GHz to 200.0 GHz) = $600 \text{ pW/cm}^2 = -1.7 \text{ dBm}$ at the DUT

Limit at 3m (200.0 GHz to 231.0 GHz) = $1000 \text{ pW/cm}^2 = +0.5 \text{ dBm}$ at the DUT

Verdict: pass

Plot 14

Date: 10.AUG.2006 10:29:16

The occupied frequency range is between 76.216 G Hz and 76.617 GHz.

So the ITU designator for this emission is 401MF0N.

Verdict: pass
