Method of Measuring Radiated Spurious Emissions

Equipment placed 80cm above ground on a rotatable platform.

2.1055(a)(1) Frequency stability:
95.623(b)

Temperature and voltage tests were performed to verify that the frequency remains within the .002%, 20 ppm specification limit. The test was conducted as follows:

The transmitter was placed in the temperature chamber at 25 degrees C and allowed to stabilize for one hour. The transmitter was keyed ON for one minute during which four frequency readings were recorded at 15 second intervals. The worse case number was taken for temperature plotting. The assigned channel frequency was considered to be the reference frequency. The temperature was then reduced to -30 degrees C after which the transmitter was again allowed to stabilize for one Hour. The transmitter was keyed ON for one minute, and again frequency readings were noted at 15 second intervals. The worst case Number was recorded for temperature plotting. This procedure was repeated in 10-degree increments up to + 50 degrees C.

Readings were also taken at the end point of the battery voltage of 7.2VDC.

MEASUREMENT DATA:

REFERENCE FREQUENCY: 72.269061

TEMPERATURE °C	FREQUENCY MHz	PPM
-30C	72.268561	-6.92
-20C	72.268824	-3.28
-10C	72.269145	1.16

40C	72.269010	-0.71
50C	72.268998	-0.87

RESULTS OF MEASUREMENTS: The maximum frequency variation over the temperature range was -6.92 to +1.16ppm. The maximum frequency variation with voltage was -0.11 ppm.
