2.2 26 dB BANDWIDTH

2.2.1 Specification Reference

FCC 47 CFR Part 15, Clause 15.403(i)

2.2.2 Standard Applicable

(i) Emission bandwidth. For purposes of this subpart the emission bandwidth shall be determined by measuring the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, that are 26 dB down relative to the maximum level of the modulated carrier. Determination of the emissions bandwidth is based on the use of measurement instrumentation employing a peak detector function with an instrument resolution bandwidth approximately equal to 1.0 percent of the emission bandwidth of the device under measurement..

2.3 MAXIMUM CONDUCTED OUTPUT POWER

2.3.1 Specification Reference

FCC 47 CFR Part 15, Clause 15.407(a)(1)(IV) and (a)(3)
RSS-247, Clause 6.2.4(1)

2.3.2 Standard Applicable

(iv) For mobile and portable client devices in the 5.15-5.25 GHz band, the maximum conducted output power over the frequency band of operation shall not exceed 250 mW provided the maximum antenna gain does not exceed 6 dBi. In addition, the maximum power spectral density shall not exceed 11 dBm in any 1 megahertz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

(3) For the band 5.725-5.85 GHz, the maximum conducted output power over the frequency band of operation shall not exceed 1 W. In addition, the maximum power spectral density shall not exceed 30 dBm in any 500-kHz band. If transmitting antennas of directional gain greater than 6 dBi are used, both the maximum conducted output power and the maximum power spectral density shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi. However, fixed point-to-point U-NII devices operating in this band may employ transmitting antennas with directional gain greater than 6 dBi without any corresponding reduction in transmitter conducted power. Fixed, point-to-point operations exclude the use of point-to-multipoint systems, omnidirectional applications, and multiple collocated transmitters transmitting the same information. The operator of the U-NII device, or if the equipment is professionally installed, the installer, is responsible for ensuring that systems employing high gain directional antennas are used exclusively for fixed, point-to-point operations.

- This is an antenna-port conducted measurement test plus radiated cabinet emissions measurements.
- Sweep time is set to auto.
- The path loss was measured and entered as a level offset
- There were no unwanted emissions observed that falls in the Restricted Bands.
- Any emissions that is not in the restricted band will be evaluated to -27dBm/MHz (U-NII 1) and -17dBm/MHz (U-NII 3) limit.
- For any emissions falling outside the restricted band, the limit of -27dBm/MHz was converted to field strength using the formula under Section H(2)(d)(i) of 789033 D01 General UNII Test Procedures v01r03:

$$E(\text{dB}\mu\text{V}/\text{m}) = 95.2 - \text{EIRP (dBm)} @ 3 \text{ meters using } 1\text{MHz RBW}$$

$$= 95.2 - 27 \text{ dBm}$$

$$= 68.2 \text{ dB}\mu\text{V}/\text{m}$$
- Radiated measurement was done using EMC32 automated software. Reported level is the actual level with all the correction factors factored in. Correction Factor column is for informational purposes only. See Section 2.5.9 for sample computation.

2.6.9 Test Results

802.11a U-NII 1 Low Channel (Ch 36) Band Edge (Peak Measurement) @ 5150 MHz

Lower band edge calculation:

- 5150 MHz (in the restricted band)
- Use the following formula as per Section H(2)(d)(i) of 789033 D01 General U-NII Test Procedures v01r03:

$$\begin{aligned}
 E(\text{dB}\mu\text{V}/\text{m}) &= \text{EIRP (dBm)} + 95.2 \\
 &= (-52.52 \text{ dBm} + 2.3 \text{ dBi antenna gain}) + 95.2 \\
 &= 44.98 \text{ dB}\mu\text{V}/\text{m} @ 3 \text{ meters}
 \end{aligned}$$
- Since 44.98 dBμV/m (Peak) is less than than the 54 dBμV/m Average limit of §15.209, then average measurement is not required.

802.11n U-NII 1 HT20 Low Channel (Ch 36) Band Edge (Peak Measurement) @ 5150 MHz

Lower band edge calculation:

- 5150 MHz (in the restricted band)

$$\begin{aligned}
 E(\text{dB}\mu\text{V/m}) &= \text{EIRP (dBm)} + 95.2 \\
 &= (-51.90 \text{ dBm} + 2.3 \text{ dBi antenna gain}) + 95.2 \\
 &= 45.6 \text{ dB}\mu\text{V/m @ 3 meters}
 \end{aligned}$$
- Since 45.6 dBμV/m (Peak) is less than than the 54 dBμV/m Average limit of §15.209, then average measurement is not required.
