ADMINISTRATIVE DATA AND SUMMARY OF TESTS

DESCRIPTION OF TEST ITEM: Frequency Hopping Spread Spectrum
Transmitter

MODEL NO. : BT0606AL09 SERIAL NO.: 00E00C496045

FCC ID NO. : None given.

MANUFACTURER: Motorola

APPLICABLE

SPECIFICATION: FCC "Code of Federal Regulations", Title 47, Part 15,
Subpart C, Sec. 15.247

TEST PERFORMED BY: ELITE ELECTRONIC ENGINEERING INC.
Downers Grove, Illinois 60515

DATES TESTED: October 28 through November 1, 2002

PERSONNEL (OPERATORS, OBSERVERS, AND CO-ORDINATORS):

WITNESS: No Motorola personnel were present during the testing.

ELITE ELECTRONIC: Richard E. King

ELITE JOB NO.: 31521

ABSTRACT: The model BT0606AL09 In-vehicle Bluetooth Module Transmitter meets the requirements of the FCC "Code of Federal Regulations", Title 47, Part 15, Subpart C, Section 15.247 for bluetooth spread spectrum transmitters. The carrier frequency separation, number of hopping frequencies, time of occupancy (dwell time), 20 dB bandwidth, peak output power, band-edge compliance, antenna conducted and radiated spurious emissions and power spectral density were measured and found to comply with the requirements.

See the test results and data pages for more details.

MEASUREMENT OF RF EMISSIONS

FROM A IN-VEHICLE BLUETOOTH MODULE TRANSMITTER

1.0 INTRODUCTION:

1.1 DESCRIPTION OF TEST ITEM: This report presents the results of the RF emissions measurements performed for the model BT0606AL09 In-Vehicle Bluetooth Module spread spectrum transmitter, (hereinafter referred to as the test item). The tests were performed for Motorola located in Elk Grove Village, Illinois.

The test item is a frequency hopping spread spectrum transceiver used for in vehicle bluetooth applications. It operates in the frequency band 2400 to 2483.5MHz.

1.2 PURPOSE: The test series was performed to determine if the test item would meet the selected requirements of the FCC "Code of Federal Regulations" Title 47, Part 15, Subpart C, Section 15.247 for intentional radiators.

1.3 DEVIATIONS, ADDITIONS AND EXCLUSIONS: There were no deviations from the test requirements.

1.4 APPLICABLE DOCUMENTS: The following documents of the exact issue designated form part of this document to the extent specified herein:

Federal Communications Commission (FCC) "Code of Federal Regulations", Title 47, Part 15, dated 1 October 2001

FCC Public Notice, DA 00-705, "Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems", Released March 30, 2000

1.5 SUBCONTRACTOR IDENTIFICATION: This series of tests was performed by the Elite Electronic Engineering Inc., of Downers Grove,

Illinois.

2.0 TEST ITEM SETUP AND OPERATION:

For all tests the test item was placed on a 0.8 meter high non-conductive table. The 7.0VDC was supplied to the test item from a power supply. The test item is supplied with an external antenna.

3.0 TEST SITE AND INSTRUMENTATION:

3.1 TEST SITE: All tests were performed at Elite's facility in Downers Grove, Illinois. All tests were performed in a hybrid anechoic/ferrite tile shielded enclosure.

3.2 TEST INSTRUMENTATION: A list of the test equipment used can be found on Table I. All equipment was calibrated per the instruction manuals supplied by the manufacturer.

4.0 REQUIREMENTS, PROCEDURES AND RESULTS:

4.1 POWER LINE CONDUCTED EMISSIONS:

4.1.1 REQUIREMENT: This requirement does not apply since the test item receives 7.0VDC from the vehicle's power supply. There are no operation modes where the transmitter can be connected to the AC power public utilities, and therefore, the conducted emissions test are not required.

4.2 CARRIER FREQUENCY SEPARATION:

4.2.1 REQUIREMENTS: Per section 15.247 (a)(1), frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25kHz or the 20dB bandwidth of the hopping channel, whichever is greater.

4.2.2 PROCEDURES: The test item was setup inside the chamber. The output of the test item was connected to the spectrum

analyzer through a 20dB pad. With the hopping function enabled, the test item was allowed to transmit continuously.

The resolution bandwidth (RBW) was set to $\geq$ to 1% of the span. The peak detector and 'Max-Hold' function was engaged. The span was set wide enough to capture the peaks of at least two adjacent channels. When the trace had stabilized after multiple scans. The marker-delta function was used to determine the separation between the peaks of the adjacent channels. The analyzer's display was plotted using a 'screen dump' utility.

4.2.3 RESULTS: : Data page 16 shows the carrier frequency separation. As can be seen from this plot, the separation is 1.020MHz which is greater than the 20dB bandwidth (925kHz).

4.3 NUMBER OF HOPPING FREQUENCIES:

4.3.1 REQUIREMENTS: Per section 15.247(a)(1)(ii), frequency hopping systems shall use at least 75 hopping frequencies.

4.3.2 PROCEDURE: The test item was setup inside the chamber. The output of the test item was connected to the spectrum analyzer through a 20dB pad. With the hopping function enabled, the test item was allowed to transmit continuously.

The resolution bandwidth (RBW) was set to $\geq$ to 1% of the span. The peak detector and 'Max-Hold' function was engaged. The span was set wide enough to capture the entire frequency band of operation.

When the trace had stabilized after multiple scans. The number of hopping frequencies was counted. The analyzer's display was plotted using a 'screen dump' utility.

4.3.3 RESULTS: Data page 17 shows the number of hopping

frequencies. As can be seen from this plot, the number of frequencies is 79 which is greater than the minimum required of 75.

4.4 TIME OF OCCUPANCY (DWELL TIME):

4.4.1 REQUIREMENTS: Per section 15.247(a)(1)(ii), the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 30 second period.

4.4.2 PROCEDURE: The test item was setup inside the chamber. The output of the test item was connected to the spectrum analyzer through a 20dB pad. With the hopping function enabled, the test item was allowed to transmit continuously.

The resolution bandwidth (RBW) was set to 1 MHz. The peak detector and 'Max-Hold' function was engaged. With the span set to 0Hz, the sweep time was adjusted to capture a single event in order to measure the dwell time per hop. Then, the sweep time was expanded to capture the average time between hops. When the trace had stabilized after multiple scans, the time between hops was measured. The analyzer's display was plotted using a 'screen dump' utility.

The dwell time in a 30 second period was then calculated from dwell time per hop divided by time between hops then multiplied by 30 seconds. The dwell time in a 30 second period was then divided by the number of frequency hopping channels to give the dwell time of a single frequency hopping channel.

4.4.3 RESULTS: Data pages 18 and 19 show the plots for the time of occupancy (dwell time). As can be seen from the plots, the time of occupancy can be determined by a 330.0 usec burst every 99.5 msec's multiplied by a 30 second period. This calculated value is

equal to 0.099 seconds which is less than the 0.4 seconds allowed.

4.5 20 dB BANDWIDTH:

4.5.1 REQUIREMENTS: Per section 15.247(a)(1)(ii), the maximum 20dB bandwidth of the hopping channel is 1MHz.

4.5.2 PROCEDURE: The test item was setup inside the chamber. The output of the test item was connected to the spectrum analyzer through a 20dB pad. With the hopping function disabled, the test item was allowed to transmit continuously. The frequency hopping channel was set separately to low, middle, and high hopping channels. The resolution bandwidth (RBW) was set to $\geq$ to 1% of the 20 dB BW.

The 'Max-Hold' function was engaged. The analyzer was allowed to scan until the envelope of the transmitter bandwidth was defined. The analyzer's display was plotted using a 'screen dump' utility.

4.5.3 RESULTS: The plots on pages 20 through 22 show that the maximum 20 dB bandwidth was 0.925 MHz. The 20 dB bandwidth was less than the 1.0MHz maximum requirement.

4.6 PEAK OUTPUT POWER:

4.6.1 REQUIREMENTS: This requirement applies only to the transmit mode of operation. Per section 15.247(b) the maximum peak output power of the transmitter shall not exceed 1 Watt. If transmitting antennas of directional gain greater than 6dBi are used, the power shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6dBi.

4.6.2 PROCEDURES: The output of the test item was connected to the power meter through a 20dB pad. The maximum meter reading was recorded. The peak power output was calculated for the low, middle and

high hopping frequencies.

4.6.3 RESULTS: The results are presented on data page 23. The maximum antenna conducted output power measured from the transmitter was 17.8 dBm which meets the 30 dBm limit. The maximum EIRP measured from the transmitter was 2.7 dBm which meets the De Facto 36 dBm limit.

4.7 BAND-EDGE COMPLIANCE:

4.7.1 REQUIREMENTS: Per section 15.247(c), the emissions at the band-edges must be at least 20dB below the highest level measured within the band. In addition, the radiated emissions which fall in the restricted band beginning at 2483.5 MHz, must meet the general limits of 15.209

4.7.2 PROCEDURE: The same data recorded for the low and high hopping frequencies from the 20 dB bandwidth measurements was used to demonstrate compliance with the 20 dB band-edge requirements.

For the radiated emissions which fall in the restricted band the "marker-delta" method described in Public Notice DA 00-705 was used. Initially radiated measurements were performed at the fundamentals of the highest hopping frequencies using 1 MHz bandwidth. For the measurements the "delta" required to meet the general limit was calculated.

Next, the band-edge emissions were plotted using peak detector and 100 kHz bandwidth. The "delta" limit was applied to this plot to determine compliance at the band-edge.

4.7.3 RESULTS: Data pages 24 through 27 show the band-edge compliance results using the marker-delta method. As can be seen from

this plots, the emissions at the band-edge in the restricted band are within the general limits.

4.8 SPURIOUS EMISSIONS:

4.8.1 ANTENNA CONDUCTED EMISSIONS

4.8.1.1 REQUIREMENTS: Per section 15.247(c), the spurious emissions in any 100 kHz BW outside the frequency band must be at least 20dB below the highest 100 kHz BW level measured within the band.

4.8.1.2 PROCEDURES: The measuring equipment was connected to the test item's antenna port. The emissions in the frequency range from 30MHz to 18GHz were observed and plotted separately with the test item transmitting at 2402.0MHz, 2441.0MHz, and 2480.0MHz.

4.8.1.3 RESULTS: The results of the antenna conducted emissions levels were plotted. These plots are presented on Data Pages 28 through 36. This plot shows that the spurious emissions were at least 20 dB below the level of the fundamental.

4.8.2 RADIATED SPURIOUS EMISSIONS:

4.8.2.1 REQUIREMENTS: Per section 15.247(c), the spurious emissions in any 100 kHz BW outside the frequency band must be at least 20dB below the highest 100 kHz BW level measured within the band. In addition, the radiated emissions which fall in the restricted bands must meet the general limits of 15.209.

4.8.2.2 PROCEDURES:

Since the test item was supplied with a permanently attached antenna, the spurious emissions compliance was evaluated against the

radiated emissions levels for unrestricted bands as well as the restricted bands.

The radiated tests were performed in a 32ft. x 20ft. x 18ft. hybrid absorber lined semi-anechoic test chamber. With the exception of the floor, the reflective surfaces of the shielded chamber are lined with ferrite tiles on the walls and ceiling. The floor of the chamber is used as the ground plane. The chamber complies with ANSI 63.4 and CISPR 16 requirements for site attenuation.

Preliminary radiated measurements are performed to determine the frequencies where the significant emissions might be found. With the test item at one set position and the measurement antenna at a set height (i.e. without maximizing), the radiated emissions were measured using peak detection with 100 kHz BW. This data was then automatically plotted up through 18 GHz. Frequency range 18 to 24 GHz was checked manually but not plotted.

Next, the harmonic or spurious emissions falling in the restricted bands were measured up through the 10th harmonic. For these measurements, the measurement bandwidths were set to 1 MHz RBW. The analyzer was set to **linear mode** with 10 Hz VBW in order to simulate an average detector. A pre-amplifier was used to increase the receiver sensitivity.

4.8.2.3 RESULTS: The preliminary emissions levels were plotted. These plots are presented on Data Pages 37 through 45. This plot shows that the spurious emissions were at least 20 dB below the level of the fundamental as transmitted through a -10dBi gain external antenna.

The harmonics and any other emissions that fall in the restricted frequency bands were then re-measured manually. This data is shown in the tables on data Pages 46 through 48. The field intensities levels for the harmonics in the restricted band were within the limit.

A block diagram of the test item orientation position is shown in Figure 1.

4.9 POWER SPECTRAL DENSITY:

4.9.1 REQUIREMENTS: Per section 15.247(d), the peak power spectral density from the intentional radiator shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

4.9.2 PROCEDURE: The output of the test item was connected to the power meter through a 20dB pad. The test item was put into inquiry mode.

The resolution bandwidth (RBW) was initially set to 3MHz to set the EIRP reference level. Knowing the EIRP peak level, the result of this plot was used to determine the 8dBm limit.

The resolution bandwidth (RBW) was set to 3kHz, the sweep time was set to the span divided by 3kHz ($1\text{MHz}/3\text{kHz} = 333$ seconds). The peak detector and 'Max-Hold' function was engaged. The analyzer's display was plotted using a 'screen dump' utility.

4.9.3 RESULTS: Data page 49 shows the power spectral density results. As can be seen from this plot, the peak power density is less than 8dBm in a 3kHz band during any time interval of continuous transmission.

5.0 CONCLUSION:

The Motorola model In-Vehicle Bluetooth Module does meet the limits imposed by the FCC "Code of Federal Regulations" Title 47, Part 15, Subpart C, Section 15.247 for bluetooth spread spectrum transmitters.

6.0 CERTIFICATION:

Elite Electronic Engineering Inc. certifies that the information contained in this report was obtained under conditions which meet or exceed those specified in the test specification.

The data presented in this test report pertains to the test item at the test date. Any electrical or mechanical modification made to the test item subsequent to the specified test date will serve to invalidate the data and void this certification.

This report must not be used to claim product endorsement by NVLAP or any agency of the US Government.

ETM 31521-02

1. What are the main components of a cell?
 2. Describe the structure and function of the nucleus.
 3. Explain the process of protein synthesis.
 4. What is the role of the Golgi apparatus?
 5. Describe the function of the mitochondria.
 6. Explain the process of cellular respiration.
 7. What is the role of the cell membrane?
 8. Describe the structure and function of the cytoplasm.
 9. Explain the process of cell division.
 10. What is the role of the endoplasmic reticulum?
 11. Describe the function of the lysosomes.
 12. Explain the process of osmosis.
 13. What is the role of the vacuole?
 14. Describe the structure and function of the chloroplast.
 15. Explain the process of photosynthesis.
 16. What is the role of the cell wall?
 17. Describe the structure and function of the plasma membrane.
 18. Explain the process of active transport.
 19. What is the role of the centrioles?
 20. Describe the structure and function of the spindle fibers.
 21. Explain the process of mitosis.
 22. What is the role of the centrosomes?
 23. Describe the structure and function of the cilia.
 24. Explain the process of meiosis.
 25. What is the role of the sex chromosomes?
 26. Describe the structure and function of the Y chromosome.
 27. Explain the process of fertilization.
 28. What is the role of the zygote?
 29. Describe the structure and function of the embryo.
 30. Explain the process of development.
 31. What is the role of the placenta?
 32. Describe the structure and function of the fetus.
 33. Explain the process of birth.
 34. What is the role of the mother?
 35. Describe the structure and function of the baby.
 36. Explain the process of growth.
 37. What is the role of the father?
 38. Describe the structure and function of the sperm.
 39. Explain the process of reproduction.
 40. What is the role of the egg?
 41. Describe the structure and function of the ovum.
 42. Explain the process of ovulation.
 43. What is the role of the fallopian tube?
 44. Describe the structure and function of the uterus.
 45. Explain the process of menstruation.
 46. What is the role of the vagina?
 47. Describe the structure and function of the vulva.
 48. Explain the process of intercourse.
 49. What is the role of the penis?
 50. Describe the structure and function of the testis.
 51. Explain the process of ejaculation.
 52. What is the role of the prostate gland?
 53. Describe the structure and function of the urethra.
 54. Explain the process of urination.
 55. What is the role of the bladder?
 56. Describe the structure and function of the rectum.
 57. Explain the process of defecation.
 58. What is the role of the anus?
 59. Describe the structure and function of the skin.
 60. Explain the process of sweating.
 61. What is the role of the hair?
 62. Describe the structure and function of the nail.
 63. Explain the process of growth and development.
 64. What is the role of the endocrine system?
 65. Describe the structure and function of the hypothalamus.
 66. Explain the process of hormone release.
 67. What is the role of the pituitary gland?
 68. Describe the structure and function of the thyroid gland.
 69. Explain the process of metabolism.
 70. What is the role of the adrenal gland?
 71. Describe the structure and function of the pancreas.
 72. Explain the process of digestion.
 73. What is the role of the liver?
 74. Describe the structure and function of the stomach.
 75. Explain the process of absorption.
 76. What is the role of the small intestine?
 77. Describe the structure and function of the large intestine.
 78. Explain the process of excretion.
 79. What is the role of the kidneys?
 80. Describe the structure and function of the bladder.
 81. Explain the process of urination.
 82. What is the role of the ureters?
 83. Describe the structure and function of the urethra.
 84. Explain the process of defecation.
 85. What is the role of the rectum?
 86. Describe the structure and function of the anus.
 87. Explain the process of reproduction.
 88. What is the role of the sex chromosomes?
 89. Describe the structure and function of the Y chromosome.
 90. Explain the process of fertilization.
 91. What is the role of the zygote?
 92. Describe the structure and function of the embryo.
 93. Explain the process of development.
 94. What is the role of the placenta?
 95. Describe the structure and function of the fetus.
 96. Explain the process of birth.
 97. What is the role of the mother?
 98. Describe the structure and function of the baby.
 99. Explain the process of growth.
 100. What is the role of the father?
