

## Exhibit 11: SAR Test Report IHDT6EC1

**Date of test:** 06/01/2004 to 06/02/2004  
**Date of Report:** 06/30/2004

**Laboratory:** Motorola Personal Communications Sector Product Safety & Compliance Laboratory  
 600 N. US Highway 45  
 Room: MW113  
 Libertyville, Illinois 60048

**Test Responsible:** Albert Patapack  
 Senior Staff Engineer

**Accreditation:** This laboratory is accredited to ISO/IEC 17025-1999 to perform the following tests:

Tests:  
 Electromagnetic Specific Absorption Rate

Procedures:  
 ANSI/IEEE C95.1-1992, 1999  
 (SAR) IEEE C95.3-1991  
 IEEE P1528 (DRAFT)  
 FCC OET Bulletin 65 (including Supplements A, B, C)  
 Australian Communications Authority Radio  
 Communications (Electromagnetic Radiation – Human  
 Exposure) Standard 1999  
 CENELEC EN 50361 (2001)  
 APP-0247  
 DOI-0876, 0900, 0902, 0904, 0915

Simulated Tissue Preparation  
 RF Power Measurement

On the following products or types of products:

Wireless Communications Devices (Examples): Two Way Radios; Portable Phones (including Cellular,  
 Licensed Non-Broadcast and PCS); Low Frequency Readers; and Pagers

A2LA certificate #1651-01

**Statement of Compliance:**

Motorola declares under its sole responsibility that portable cellular telephone FCC ID IHDT6EC1 to which this declaration relates, is in conformity with the appropriate General Population/Uncontrolled RF exposure standards, recommendations and guidelines (FCC 47 CFR §2.1093). It also declares that the product was tested in accordance with the appropriate measurement standards, guidelines and recommended practices. Any deviations from these standards, guidelines and recommended practices are noted below:

(none)

## 1 Introduction

The Motorola Personal Communications Sector Product Safety Laboratory has performed measurements of the maximum potential exposure to the user of portable cellular phone (FCC ID IHDT6EC1). The Specific Absorption Rate (SAR) of this product was measured. The portable cellular phone was tested in accordance with FCC OET Bulletin 65 Supplement C 01-01.

## 2 Description of the Device Under Test

### 2.1 Antenna description

### 3 Test Equipment Used

#### 3.1 Dosimetric System

The Motorola Personal Communications Sector Product Safety & Compliance Laboratory utilizes a Dosimetric Assessment System (Dasy3™ v3.1d) manufactured by Schmid & Partner Engineering AG (SPEAG™), of Zurich Switzerland. All the SAR measurements are taken within a shielded enclosure. The overall RSS uncertainty of the measurement system is  $\pm 11.7\%$  (K=1) with an expanded uncertainty of  $\pm 23.0\%$  (K=2). The measurement uncertainty budget is given in Appendix 6. Per IEEE 1528, this uncertainty budget is applicable to the SAR range of 0.4 W/kg to 10 W/kg. The list of calibrated equipment used for the measurements is shown below.

| Description                     | Serial Number | Cal Due Date |
|---------------------------------|---------------|--------------|
| DASY3 DAE V1                    | 376           | 12/22/2004   |
| E-Field Probe ET3DV6            | 1391          | 11/24/2004   |
| Dipole Validation Kit, D1800V2  | 273tr         | 04/02/2004   |
| S.A.M. Phantom used for 1900MHz | TP-1235       |              |

#### 3.2 Additional Equipment

| Description                   | Serial Number | Cal Due Date |
|-------------------------------|---------------|--------------|
| Signal Generator HP8648C      | 3847A04845    | 11/5/2004    |

| Power Sensor #1 - E9301A      | US39210917    | 8/5/2004     |
| Power Sensor #2 - E9301A      | US39210918    | 8/5/2004     |
| Network Analyzer HP8753ES     | US39172529    | 10/29/2004   |
| Dielectric Probe Kit HP85070B | US99360070    | N/A          |

### 4 Electrical parameters of the tissue simulating liquid

Prior to conducting SAR measurements, the relative permittivity,  $\epsilon_r$ , and the conductivity,  $\sigma$ , of the tissue simulating liquids were measured with the HP85070 Dielectric Probe Kit. These values, along with the temperature of the tissue simulate are shown in the table below. The recommended limits for maximum permittivity and minimum conductivity are also shown. These come from the Federal Communication Commission, OET Bulletin 65 Supplement C 01-01. It is seen that the measured parameters are satisfactory for compliance testing.

| f<br>(MHz) | Tissue<br>type | Limits / Measured      | Dielectric Parameters |                |              |
|------------|----------------|------------------------|-----------------------|----------------|--------------|
|            |                |                        | $\epsilon_r$          | $\sigma$ (S/m) | Temp<br>(°C) |
| 1880       | Head           | Measured, 06/01/2004   | 38.9                  | 1.46           | 19.3         |
|            |                | Recommended Limits     | 40.0 $\pm 5\%$        | 1.40 $\pm 5\%$ | 18-25        |
|            | Body           | Measured, , 06/01/2004 | 50.8                  | 1.58           | 19.4         |
|            |                | Measured, , 06/02/2004 | 50.7                  | 1.58           | 19.3         |
|            |                | Recommended Limits     | 53.3 $\pm 5\%$        | 1.52 $\pm 5\%$ | 18-25        |

The list of ingredients and the percent composition used for the tissue simulates are indicated in the table below.

| <b>Ingredient</b> | <b>800MHz<br/>Head</b> | <b>800MHz<br/>Body</b> | <b>1900MHz<br/>Head</b> | <b>1900MHz<br/>Body</b> |
|-------------------|------------------------|------------------------|-------------------------|-------------------------|

## 5 System Accuracy Verification

A system accuracy verification of the DASY3 was performed using the measurement equipment listed in Section 3.1. The daily system accuracy verification occurs within center section of the SAM phantom.

A SAR measurement was performed to see if the measured SAR was within +/- 10% from the target SAR indicated on the dipole certification sheet. These tests were done at 900MHz and/or 1800MHz. These frequencies are within 100MHz of the mid-band frequency of the test device. This is within the allowable window given in Supplement C 01-01 *Appendix D System Verification* section item #5. The test was conducted on the same days as the measurement of the DUT. Recommended limits for maximum permittivity, minimum conductivity are shown in the table below. These come from the Federal Communication Commission, OET Bulletin 65 Supplement C 01-01. The obtained results from the system accuracy verification are displayed in the table below. The distributions of SAR compare well with those of the reference measurements (see Appendix 1). The tissue stimulant depth was verified to be 15.0cm  $\pm$  0.5cm. Z-axis scans showing the SAR penetration are also included in Appendix 1. SAR values are normalized to 1W forward power delivered to the dipole.

| <b>f<br/>(MHz)</b> | <b>Description</b>            | <b>SAR<br/>(W/kg),<br/>1gram</b> | <b>Dielectric Parameters</b> |                | <b>Ambient<br/>Temp<br/>(°C)</b> | <b>Tissue<br/>Temp<br/>(°C)</b> |

|                    |                               |                                  | <b>e<sub>r</sub></b>         | <b>s (S/m)</b> |                                  |                                 |
| <b>1800</b>        | <b>Measured, , 06/01/2004</b> | 41.0                             | 38.2                         | 1.37           | 20.0                             | 19.3                            |
|                    | <b>Measured, , 06/02/2004</b> | 40.95                            | 39.7                         | 1.36           | 20.0                             | 19.4                            |
|                    | <b>Recommended Limits</b>     | 40.7                             | 40.0 $\pm$ 5%                | 1.4 $\pm$ 5%   | 18-25                            | 18-25                           |

The following probe conversion factors were used on the E-Field probe(s) used for the system accuracy verification measurements:

| <b>Description</b>      | <b>Serial<br/>Number</b> | <b>f (MHz)</b> | <b>Conversion<br/>Factor</b> | <b>Cal Cert<br/>pg #</b> |
|-------------------------|--------------------------|----------------|------------------------------|--------------------------|
| E-Field Probe<br>ET3DV6 | 1391                     | 1800           | 5.3                          | 2 of 10                  |

## 6 Test Results

The test sample was operated in a test mode that allows control of the transmitter without the need to place actual phone calls. For the purposes of this test the unit is commanded to test mode and manually set to the proper channel, transmitter power level and transmit mode of operation. The phone was tested in the configurations stipulated in OET Bulletin 65 Supplement C 01-01. Motorola also followed the requirements in Supplement. C / Appendix D: SAR Measurement Procedures, section titled *"Devices Operating Next To A Person's Ear"*. These directions state "The device should be tested on the left and right side of the head phantom in the "Cheek/Touch" and "Ear/Tilt" positions. When applicable, each configuration should be tested with the antenna in its fully extended and fully retracted positions. These test configurations should be tested at the high, middle and low frequency channels of each operating mode; for example, AMPS, CDMA, and TDMA. If the SAR measured at the middle channel for each test configuration (left, right, Cheek/Touch, Tile/Ear, extended and retracted) is at least 2.0 dB lower than the SAR limit, testing at the high and low channels is optional for such test configuration(s)."

The DASY v3.1d SAR measurement system specified in section 3.1 was utilized within the intended operations as set by the SPEAG™ setup. The phone was positioned into the measurement configurations using the positioner supplied with the DASY 3.1d SAR measurement system. The measured dielectric constant of the material used for the positioner is less than 2.9 and the loss tangent is less than 0.02 ( $\pm 30\%$ ) at 850MHz. The default settings for the "coarse" and "cube" scans were chosen and use for measurements. The grid spacing of the coarse scan was set to 15cm as shown in the SAR plots included in appendix 2 and 3 Please refer to the DASY manual for additional information on SAR scanning procedures and algorithms used.

The Cellular Phone (FCC ID IHDT6EC1) has 780mAh SNN5683A as the only available battery option. This battery was used to do all of the SAR testing. The phone was placed in the SAR measurement system with a fully charged battery.

### 6.1 Head Adjacent Test Results

To aid in positioning repeatability, the ear reference line of the device and the axis reference line of the device have been physically added using a non-metallic marker.

- Per Figure 1, the "Ear Reference Line" is centered vertically through the center of the listening area (as defined by the speaker holes in the housing).
- The "Axis Reference Line" bisects the front surface of the device at its top and bottom edges.
- The intersection of these two lines defines the location of the "Ear Reference Point".

The lines drawn on the device extended to the outside edges, as shown in blue in the figure below, and wrap around the sides of the device.

The SAR results shown in tables 1 and 2 are maximum SAR values averaged over 1 gram of phantom tissue. Also shown are the measured conducted output powers, the temperature of the test facility during the test, the temperature of the tissue simulate after the test, the measured drift and the extrapolated SAR. The exact method of extrapolation is  $\text{New SAR} = \text{Old SAR} * 10^{(-\text{drift}/10)}$ . The SAR reported at the end of the measurement process by the DASY™ measurement system can be scaled up by the measured drift to determine the SAR at the beginning of the measurement process. This is the most conservative SAR because it corresponds to the average output power at the beginning of the SAR test. This extrapolation has been done because when the DUT is operating properly it may exhibit a slump in radiated power and SAR over time. This is verified by measuring the SAR drift after the test. The test conditions indicated as bold numbers in the following table are included in Appendix 2

The SAR measurements were performed using the SAM phantoms listed in section 3.1. Since same phantoms and tissue simulate are used for the system accuracy verification as the device SAR measurements, the Z-axis scans included in within Appendix 1 are applicable for verification of tissue simulate depth to be 15.0cm ±0.5cm. All other test conditions measured lower SAR values than those included in Appendix 2. Note that 800MHz digital mode SAR measurements were performed in accordance with Supplement C.

The following probe conversion factors were used on the E-Field probe(s) used for the head adjacent measurements:

| Description          | Serial Number | f (MHz) | Conversion Factor | Cal Cert pg # |
|----------------------|---------------|---------|-------------------|---------------|
| E-Field Probe ET3DV6 | 1391          | 1800    | 5.3               | 7 of 10       |

| f (MHz)         | Description | Conducted Output Power (dBm) | Cheek / Touch Position |              |                      |                    |                 |              |                      |                    |

## 6.2 Body Worn Test Results

The SAR results shown in tables 3 and 4 are the maximum SAR values averaged over 1 gram of phantom tissue. Also shown are the measured conducted output powers, the temperature of the test facility during the test, the temperature of the tissue simulate after the test, the measured drift and the extrapolated SAR. The exact method of extrapolation is  $\text{New SAR} = \text{Old SAR} * 10^{(-\text{drift}/10)}$ . The SAR reported at the end of the measurement process by the DASY™ measurement system can be scaled up by the measured drift to determine the SAR at the beginning of the measurement process. This is the most conservative SAR because it corresponds to the average output power at the beginning of the SAR test. This extrapolation has been done because when the DUT is operating properly it may exhibit a slump in radiated power and SAR over time. This is verified by measuring the SAR drift after the test. The test conditions indicated as bold numbers in the following table are included in Appendix 3. Note that 800MHz digital mode SAR measurements were performed in accordance with OET Bulletin 65 Supplement C 01-01. All other test conditions measured lower SAR values than those included in Appendix 3.

A “flat” phantom was for the body-worn tests. This “flat” phantom is made out of 1” thick natural High Density Polyethylene with a thickness at the bottom equal to 2.0mm. It measures 52.7cm(long) x 26.7cm(wide) x 21.2cm(tall). The measured dielectric constant of the material used is less than 2.3 and the loss tangent is less than 0.0046 all the way up to 2.184GHz.

The tissue stimulant depth was verified to be 15.0cm ±0.5cm. The same device holder described in section 6 was used for positioning the phone. There are no Body-Worn Accessories available for this phone at the time of testing hence the device was tested per the supplement C testing guidelines for devices that do not have body worn accessories. The phone was placed a maximum of 1 inch away from a flat phantom per the supplement C standard guidelines to perform SAR measurement. The cellular phone was tested with a headset connected to the device for all body-worn SAR measurements.

The following probe conversion factors were used on the E-Field probe(s) used for the body worn measurements:

| Description          | Serial Number | f (MHz) | Conversion Factor | Cal Cert pg # |
|----------------------|---------------|---------|-------------------|---------------|
| E-Field Probe ET3DV6 | 1391          | 1800    | 4.9               | 8 of 10       |

| f (MHz)         | Description | Conducted Output Power (dBm) | Body Worn                              |              |                      |                    |                                       |             |                      |                    |
|-----------------|-------------|------------------------------|----------------------------------------|--------------|----------------------|--------------------|---------------------------------------|-------------|----------------------|--------------------|
|                 |             |                              | Front of phone 15 mm away from phantom |              |                      |                    | Back of phone 15 mm away from phantom |             |                      |                    |

Motorola (MRO)

## CALIBRATION CERTIFICATE

Object(s)

ET3DV6 - SN: 1391

Calibration procedure(s)

QA CAL-01 v2  
Calibration procedure for dosimetric E-field probes

Calibration date:

November 24, 2003

Condition of the calibrated item

In Tolerance (according to the specific calibration document)

This calibration statement documents traceability of M&TE used in the calibration procedures and conformity of the procedures with the ISO/IEC 17025 international standard.

All calibrations have been conducted in the closed laboratory facility: environment temperature 22 +/- 2 degrees Celsius and humidity < 75%.

Calibration Equipment used (M&TE critical for calibration)

| Model Type                        | ID #           | Cal Date (Calibrated by, Certificate No.) | Scheduled Calibration  |
|-----------------------------------|----------------|-------------------------------------------|------------------------|
| Power meter EPM E4419B            | GB41293874     | 2-Apr-03 (METAS, No 252-0250)             | Apr-04                 |
| Power sensor E4412A               | MY41495277     | 2-Apr-03 (METAS, No 252-0250)             | Apr-04                 |
| Reference 20 dB Attenuator        | SN: 5086 (20b) | 3-Apr-03 (METAS No. 251-0340)             | Apr-04                 |
