

Measurement of RF Interference from a
Model TCU15P01_M1297C
In-Vehicle Bluetooth Module Transmitter

For : Motorola TCG
21440 W. Lake Cook Rd
Deer Park, IL 60010

P.O. No. :
Date Received : November 14, 2005
Date Tested : November 14, 2005
Test Personnel: Richard E. King
Specification : FCC "Code of Federal Regulations" Title 47 Part 15,
Subpart C, Section 15.247 for Frequency Hopping
Spread Spectrum Intentional Radiators Operating within
the 2400-2483.5MHz band.

Test Report By : *Richard E. King*
EMC Engineer

Approved By : *Raymond J. Klouda*

**Measurement of RF Interference from a
Model TCU15P01_M1297C In-Vehicle Bluetooth Module Transmitter**

1.0 INTRODUCTION:

1.1 Description of Test Item - This document represents the results of the series of radio interference measurements performed on an In-Vehicle Bluetooth Module spread spectrum transmitter, Model No. TCU15P01_M1297C, Serial No. IU00000107, (hereinafter referred to as the test item). The test item is a frequency hopping spread spectrum transceiver used in vehicle bluetooth applications. It transmits in the 2400MHz to 2483.5MHz band and uses an external flat panel antenna. The test item has the identical transmitter characteristics of the Model No. TCU1P03_M1202D tested in Elite Electronic Engineering's Engineering Test Report No. 33977-01 and certified under FCC ID: IHDT6EM1. The test item was manufactured and submitted for testing by Motorola TCG located in Deer Park, IL.

1.2 Purpose - The test series was performed to determine if the modified test item continues to meets the radiated RF emission requirements of the FCC "Code of Federal Regulations" Title 47, Part 15, Subpart C, Sections 15.247 for Intentional Radiators as pertaining to a Class I or Class II permissive change. No Transmitter characteristics test were performed because the test item utilizes the same transmitter chipset as tested in Elite Electronic Engineering's Engineering Test Report No. 33977-01. Testing was performed in accordance with ANSI C63.4-2003.

1.3 Deviations, Additions and Exclusions - There were no deviations, additions to, or exclusions from the test specification during this test series.

1.4 Applicable Documents - The following documents of the exact issue designated form part of this document to the extent specified herein:

- Federal Communications Commission "Code of Federal Regulations", Title 47, Part 15, Subpart C, dated 1 October 2004
- FCC Public Notice, DA 00-705, "Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems", Released March 30, 2000
- ANSI C63.4-2003, "American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz"

1.5 Subcontractor Identification - This series of tests was performed by Elite Electronic

Engineering Incorporated of Downers Grove, Illinois. The laboratory is accredited by the National Institute of Standards and Technology (NIST) under the National Voluntary Laboratory Accreditation Program (NVLAP). NVLAP Lab Code: 100278-0.

1.6 Laboratory Conditions - The temperature at the time of the test was 21°C and the relative humidity was 55%.

2.0 TEST ITEM SETUP AND OPERATION:

The test item is an In-Vehicle Bluetooth Module, Part No.TCU15P01_M1297C. A block diagram of the test item setup is shown as Figure 1.

2.1 Power Input - The test item obtained 5 VDC power through two leads from a BK Precision Model 1670 power supply. The power supply received 115V 60Hz power through lowpass powerline filters on the wall of the shielded enclosure. The leads from the power supply to the test item were approximately 6 inches long.

2.2 Grounding - Since only two wires were used to provide the input power, the test item was ungrounded during the tests.

2.3 Support Equipment - The following support equipment was submitted with the test item:

Item	Description
Flat Panel Antenna	S/N IU00000107

2.4 Interconnect Cables - The following interconnect cables were submitted with the test item:

Item	Description
Antenna Cable	23cm long
RS232 Cable	Used for programming only - Unterminated for radiated tests and connected to computer during conducted tests

2.5 Operational Mode - The test item and all support equipment was placed on an 80cm high non-conductive stand. The test item and all support equipment were energized. The test item was set to transmit at frequencies of 2402MHz, 2441MHz and 2480MHz.

3.0 TEST EQUIPMENT:

3.1 Test Equipment List - A list of the test equipment used can be found on Table I. All equipment was calibrated per the instruction manuals supplied by the manufacturer.

3.2 Calibration Traceability - Test equipment is maintained and calibrated on a regular basis.

All calibrations are traceable to the National Institute of Standards and Technology (NIST).

4.0 REQUIREMENTS, PROCEDURES AND RESULTS:

4.1 Powerline Conducted Emissions

4.1.1 Requirements – This requirement is not applicable since the test item receives 5VDC from the vehicle's power supply. There are no operational modes where the transmitter can be connected to the AC power public utilities. Therefore, the conducted emissions measurements are not required.

4.2 Spurious Emissions

4.2.1 Antenna Conducted

4.2.1.1 Requirement – Per section 15.247(c), the spurious emissions in any 100 kHz BW outside the frequency band must be at least 20dB below the highest 100 kHz BW level measured within the band.

4.2.1.2 Procedures – The measuring equipment was connected to the test item's antenna port. The emissions in the frequency range from 30MHz to 25GHz were observed and plotted separately with the test item transmitting at 2402MHz, 2441MHz, and 2480MHz. Compliance above 25GHz is demonstrated with radiated measurements.

4.2.1.3 Results - The results of the antenna conducted emissions levels were plotted. These plots are presented on pages 11 through 19. These plots show that the spurious emissions were at least 20 dB below the level of the fundamental.

4.2.2 Radiated Spurious Emissions

4.2.2.1 Requirement – Per section 15.247(c), the radiated emissions which fall in the restricted bands must meet the general limits of 15.209.

4.2.2.2 Procedures – The radiated tests were performed in a 32ft. x 20ft. x 18ft. hybrid absorber lined semi-anechoic test chamber. With the exception of the floor, the reflective surfaces of the shielded chamber are lined with ferrite tiles on the walls and ceiling. The floor of the chamber is used as the ground plane. The chamber complies with ANSI 63.4 and CISPR 16 requirements for site attenuation.

Preliminary radiated measurements are performed to determine the frequencies where the significant emissions might be found. With the test item at one set position and the measurement antenna at a set height (i.e. without maximizing), the radiated emissions were measured using peak detection with 100 kHz BW. This data was then automatically plotted up through 18 GHz. The

frequency range from 18 to 25 GHz was checked manually but not plotted.

Next, the harmonic or spurious emissions falling in the restricted bands were measured up through the 10th harmonic. For the measurements above 1GHz, the measurement bandwidth was set to 1 MHz RBW. The analyzer was set to **linear mode** with 10 Hz VBW in order to simulate an average detector. A pre-amplifier was used to increase the receiver sensitivity.

4.2.2.3 Results - The preliminary emissions levels were plotted. These plots are presented on pages 21 through 32. These plots indicate that the radiated spurious emissions were below the general limit.

The harmonics and any other emissions that fall in the restricted frequency bands were then re-measured manually. This data is shown in the tables on pages 33 through 35. The field intensities levels for the harmonics in the restricted band were within the limit.

5.0 CONCLUSIONS:

It was determined that the Motorola TCG In-Vehicle Bluetooth Module, Part No. TCU15P01_M1297C, Serial No. IU00000107, did continue to fully meet the conducted and radiated emission requirements of the FCC "Code of Federal Regulations" Title 47, Part 15, Subpart C, Section 15.247 for Bluetooth spread spectrum transmitters. It was also determined that the Motorola TCG In-Vehicle Bluetooth Module, Part No. TCU15P01_M1297C, Serial No. IU00000107, met the radiated emission requirements. When the emission levels were compared to original test, the levels were significantly different. Therefore, the changes were qualified as a Class II permissive change.

6.0 CERTIFICATION:

Elite Electronic Engineering Incorporated certifies that the information contained in this report was obtained under conditions which meet or exceed those specified in the test specifications.

The data presented in this test report pertains to the test item at the test date. Any electrical or mechanical modification made to the test item subsequent to the specified test date will serve to invalidate the data and void this certification.

7.0 ENDORSEMENT DISCLAIMER:

This report must not be used to claim product endorsement by NVLAP or any agency of the US Government.
