1. VERIFICATION OF COMPLIANCE

COMPANY NAME: PROXIM, INC.
510 DEGUIGNE DRIVE
SUNNYVALE, CA 94085

TELEPHONE NO : (408) 731-2700

TECHNICAL PERSON: PETE GARCIA/SENIOR RF TECHNICIAN/(408) 731-2762
INFORMATION CONTACT: KEITH GLOVER/VP OF FINANCE/(408) 731-2706

EUT DESCRIPTION : PC CARD WIRELESS LAN ADAPTER

MODEL NAME : PROXIM 4440 SYMPHONY HOME RF PC CARD

DATE TESTED : JUNE 15, 2001

LIMITS APPLY TO: FCC PART 15 SECTION 15.247

TECHNICAL LIMITS	TEST RESULT
Radiated Emission/15.205 & 15.209	Complies
Radiated Emission/15.109	Complies
AC Line Conducted Emission	Complies
Minimum 20dB Bandwidth	Complies
RF Power Output	Complies
Minimum Number of Hopping Channels	Complies
Channel Separation	Complies
Average Time of Channel Occupancy	Complies

Compliance Engineering Services, Inc. tested the above equipment for compliance with the requirements set forth in CFR 47 PART 15, SUBPART C. This said equipment in the configuration described in this report shows the maximum emission levels emanating from equipment are within the compliance requirements.

STEVE CHENG/EMC ENG. MANAGER
COMPLIANCE CERTIFICATION SERVICES, INC.

DATE

Warning: This document reports conditions under which testing was conducted and results of tests performed. This document may not be altered or revised in any way unless done so by Compliance Certification Services and all revisions are duly noted in the revision section. Any alteration of this document not carried out by Compliance Certification Services will

2. DESCRIPTION OF EQUIPMENT UNDER TEST (EUT)

The product is a FHSS WLAN adapter operating in the 2.4-2.4835GHz bands with a nominal TX output power of 100mW. It is an enclosed circuit board assembly with a 68-pin data/power connector and a coaxial antenna connector.

3. ANTENNA CONNECTION

The PROXIM 4440 SYMPHONY HOME RF PC CARD is marketed with two specific antennas. Model "PROXIM 4440" is normally shipped with a 0 dBi snap-on antenna. An optional 1 dBi dipole antenna is also offered. Please refer to ATTACHMENT#7: ANTENNA REQUIREMENT.

To comply with 15.203, this product has an MMCX antenna connector to provide a unique coupling to the intentional radiator. The Manufacturer's control drawing is in Attachment 7.

4. PSEUDORANDOM HOPPING SEQUENCE

Please refer to ATTACHMENT#8: **CONFIDENTIALITY PACKAGE**.

5. CHANNEL USAGE

Please refer to ATTACHMENT#8: **CONFIDENTIALITY PACKAGE**.

6. THEORY OF OPERATION

Please refer to ATTACHMENT#8: **CONFIDENTIALITY PACKAGE**.

7. THE COORDINATION OF FREQUENCY HOPPING SYSTEM

Please refer to ATTACHMENT#8: **CONFIDENTIALITY PACKAGE**.

8. RECEIVER TECHNICAL INFORMATION

To describe system receiver input bandwidth and system receiver hopping capability
Please refer to ATTACHMENT#5: **EUT TECHNICAL DESCRIPTION** exhibit.

9. TEST LOCATION

All emissions tests were performed at:

Compliance Consulting Services
561F Monterey Road
Morgan Hill, CA 95087
Contact Person: Steve Cheng/EMC Engineering Manager

CCS has site descriptions on file with the FCC for 10 and 3 meter site configurations. CCS is a NVLAP accredited facility.

Radiated emissions from the digital portion of the EUT were performed on site A, one of the 10-meter sites.

11. TEST PROCEDURES AND TEST RESULTS

Radiated Emissions (Restricted Bands of Operation)

Test Requirement: 15.205

Measurement Equipment Used:

HP 8593EM Spectrum Analyzer

HP8449B PRE-AMPLIFIER 1 –26.5 GHz

EMCO 3115 Horn Antenna, 1-18 GHz

ARA MWH1826/B Antenna, 18-26 GHz

FLEXCO Cables, 14ft (loss: 0.85 dB/ft@ 26 GHz)

FYS Microwave: High Pass Filter 4.305 GHz

NBP-1011: Band Pass Filter 4-8 GHz

Test Procedures

1. The EUT was placed on a wooden table on the outdoor ground plane. The search antenna was placed 3 M and 1 M from the EUT. Measurement distance is chosen so that the noise floor of the measurement system is at least 6dB below the specification limits. The EUT frequency hopping sequence disabled and set the EUT to transmit at its lowest channel first.

2. The turntable was slowly rotated to locate the direction of maximum emission at each emission falling in the restricted bands of 15.205.
3. Once maximum direction was determined, the search antenna was raised and lowered in both vertical and horizontal polarizations. The maximum readings so obtained are recorded in the data listed below.
4. Steps 1 to 3 were repeated for the middle and high channel
5. To ensure that the devices lowest and highest frequency of operation complies with 15.205, radiated peak and average measurements were made at the respective bandedge and plots are attached in pages 11 and 12.

Test Results:

Refer to attached spreadsheets.

Radiated Emissions

Test Requirement: 15.209

Measurement Equipment Used:

HP 8566B Spectrum Analyzer

SCHAFFNER-CHASE BILOG Antenna, 30 - 2 GHz

HP 8447D Amplifier

TEST PROCEDURE:

The EUT was placed on a turntable at a distance of 3 meters from a BILOG search antenna. The unit was set to transmit while hopping normally. The antenna was raised and lowered, the EUT rotated on the turntable, until the EUT azimuth, antenna elevation, and antenna polarity were found which yielded maximum received emission levels on the spectrum analyzer.

Test Result:

Refer to attached tabular data sheet.

Conducted Emission

Test Requirement: 15.247(c)

Measurement Equipment Used:

HP 8566B Spectrum Analyzer

Test Set-up

Test Procedure:

The RF output port of the EUT was attached to an MMCX to SMA adapter and connected to the spectrum analyzer through a 2 feet RG-316 cable. Total path loss including cable, adapter, and attenuator at 2.4 to 2.5GHz was 11.5dB.

The EUT was configured on a test bench as shown above. The EUT was set to transmit while hopping normally. The spectrum analyzer was placed in MAX Hold mode, and individual sweeps were recorded with spectrum analyzer RES BW and VID BW set to 100KHz. The first plot shows spectrum analyzer START FREQUENCY set to 30 MHz and STOP FREQUENCY set to 2.5GHz. The second plot shows spectrum analyzer START FREQUENCY set to 2.0GHz and STOP FREQUENCY set to 2.68GHz. The third plot shows spectrum analyzer START FREQUENCY set to 2.6GHz and STOP FREQUENCY set to 22GHz. All emissions were compared to the 20-dB attenuation requirement.

Test Requirement: 15.247(c)

Measurement Equipment Used:

HP 8566B Spectrum Analyzer

Test Set-up**Test Procedure:**

The RF output port of the EUT Was attached to an MMCX to SMA adapter and connected to the spectrum analyzer through a 2 feet RG-316 cable. Total path loss including cable, adapter, and attenuator at 2.4 to 2.5GHz was 11.5dB.

The EUT was configured on a test bench as shown above. The EUT was made to transmit uninterrupted random data on the low and high channel.

Spectrum analyzer CENTER FREQUENCY set to Low Channel (2402 MHz). SPAN set to 30MHz. RES BW and VIDEO BW both set to 300KHz. The spectrum analyzer was put into MAX HOLD mode. Using the delta marker function, the delta between the signal level at Low Channel and the signal level at 2400MHz was determined.

The above steps were repeated for HIGH Channel (2480 MHz) with delta markers set to High Channel (2480 MHz) and 2483.5 MHz.

To ensure that EUT will continue compliance with the Band-edge emission in normal hopping mode operation; the EUT was put back to the normal working condition (i.e. hopping mode enabled). And test repeated again.

Test Result:

Please refer to attached plots.

20dB Bandwidth for FHSS

Test Requirement: 15.247(a)(1)(ii)

Measurement Equipment Used:

HP 8566B Spectrum Analyzer

Test Set-up**Test Procedure:**

The RF output port of the EUT was attached to an MMCX to SMA adapter and connected to the spectrum analyzer through a 2 feet R-316 cable. Total path loss including cable, adapter, and attenuator at 2.4 to 2.5GHz was 11.5dB.

The EUT was configured on a test bench as shown above. The EUT was made to transmit uninterrupted random data on each of the low/mid/high channels. Spectrum analyzer CENTER FREQUENCY set to Low Channel (2402MHz). SPAN set to 3 MHz. RES BW=30KHz. The above steps were repeated for MID Channel (2440 MHz) and HIGH Channel (2480 MHz).

The low/mid/high channels for high rate mode are 2405, 2440, and 2475MHz. Spectrum analyzer SPAN set to 20MHz, RES BW=VID BW=30kHz.

Test Results: Refer to attached spectrum analyzer data chart and plots.

RF Power Output

Test Requirement: 15.247(b)(1)

Measurement Equipment Used:

HP 8566B Spectrum Analyzer

Test Set-up

Test Procedure

The RF output port of the EUT was attached to an MMCX to SMA adapter and connected to the Power Meter through a 2 feet RG-316 cable.

The EUT was configured on a test bench as shown above. The EUT was made to transmit uninterrupted random data on each of the low/mid/high channels.

Test Results:

CHANNEL	dBm	Watts	LIMIT (W)	LIMIT (dBm)	RESULT
2402MHz	18.60	0.072	1	30	COMPLIES
2440MHz	18.65	0.073	1	30	COMPLIES
2480MHz	18.59	0.072	1	30	COMPLIES

RF EXPOSURE REQUIREMENT

Test Requirement: 15.247(b)(4)

§ 1.1310 Radio frequency radiation exposure

TABLE 1—LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE)

Frequency range (MHz)	Electric field Strength (V/m)	Magnetic field Strength (A/m)	Power density (mW/cm ²)	Averaging time (minutes)
(B) Limits for General Population/Uncontrolled Exposure				
0.3–1.34	614	1.63	*(100)	30
1.34–30	824/f	2.19/f	*(180/f ²)	30
30–300	27.5	0.073	0.2	30
300–1500			f/1500	30
1500–100,000			1.0	30

Test result:

TABLE 1 (B) LIMITS FOR GENERAL POPULATION/UNCONTROLLED EXPOSURE

F(MHz) **(POWER DENSITY (mW/cm²))**

1500 - 100,000 1

Transmitter Output power is **0.0724 Watts** and will be used with a **1 dBi (1.26 numerically)** antenna**Computation method:**

$$P = E^2 / 3770$$

$$\sqrt{E^2} = \sqrt{1 \text{ mW/cm}^2 * 3770}$$

$$E = 61.4 \text{ V/m}$$

$$E = \frac{\sqrt{30 * P * G}}{D}$$

$$D = \frac{\sqrt{30 * 0.070 * 1.26}}{61.4 \text{ V/m}}$$

$$D = 2.7 \text{ cm}$$

$$2.64 / 2.54 = 1.06 \text{ inch}$$

MPE distance requirement is 1.06 inch. A warning statement with a MPE distance requirement of 20cm is placed in the manual.

Minimum Number of Hopping Channel

Test Requirement: 15.247(a)1(ii)

Measurement Equipment Used:

HP 8566B Spectrum Analyzer

Test Set-up**Test Procedure:**

1. The RF output port of the EUT was attached to an MMCX to SMA adapter and connected to the spectrum analyzer through a 2 feet RF-316 cable. Total path loss including cable, adapter, and attenuator at 2.4 to 2.5GHz was 11.5dB.
2. Turn on the transmitter in normal hopping mode. The emissions will “paint” the spectrum analyzer screen with individual traces from each transmit channel. Allow the transmitter to run for at least 3 minutes or until there are no more changes to the display.
3. Count the number of individual channel traces and compare to the design goal.

Test Results:

Frequency Range	Number of Hopping Channel
2.40000-2.4800GHz	75

Please refer to attached spectrum plots.

Hop Channel Separation

Test Requirement: 15.247(a)(1)(ii)

Measurement Equipment Used:

HP 8566B Spectrum Analyzer

Test Set-up

Test Procedure:

The RF output port of the EUT was attached to an MMCX to SMA adapter and connected to the spectrum analyzer through a 2-foot RG-316 cable. Total path loss including cable, adapter, and attenuator at 2.4 to 2.5GHz was 11.5dB.

Turn on the transmitter in normal hopping mode. The emissions will “paint” the spectrum analyzer screen with individual traces from each transmit channel. Allow the transmitter to run for at least 3 minutes or until there are no more changes to the display. Move MARKER to the channel, which appears to have widest Channel separation and calculate the DELTA between two markers.

Test Result:

Please refer to attached spectrum plot.

Average Time of Channel Occupancy

Test Requirement: 15.247(a)1 (ii)

Measurement Equipment Used:

HP 8566B Spectrum Analyzer

Test Set-up

Test Procedure:

The RF output port of the EUT was attached to an MMCX to SMA adapter and connected to the spectrum analyzer through a 2 feet RG-316 cable. Total path loss including cable, adapter, and attenuator at 2.4 to 2.5GHz was 11.5dB.

Set the transmitter to operate in its normal frequency hopping mode.

Set the spectrum analyzer Center Frequency at 2.440GHz. Set the Sweep Time to 30 seconds. Set Trace to Max Hold. Set the Amplitude function to Linear.

The maximum number of transmissions detected in any 30 Second periods determines the maximum time of channel occupancy.

The duration of each transmission is measured with RBW=VBW=300kHz. SPAN set to 0 Hz. SWP set to 50.0msec.

Test Results:

Average time of single channel occupancy: 0.0154 seconds

Average number of times any individual channel is used within any 30 seconds: 20

$20 \times 0.0154 = 0.308 \text{ second} < 0.4 \text{ second (limit)}$

Please refer to attached spectrum plots (two pages)
