Customer P.O.: 50901

Date of Report Revision: July 18, 2017

Test Report No: R-6201N-1, Rev. A

Test Start Date: May 16, 2017

Test Finish Date: May 17, 2017

Test Technician: M. Seamans

Report Revision Approved By: T. Hannemann

Report Revision Prepared By: J. Ramsey

Our letters, procedures and reports are for the exclusive use of the customer to whom they are addressed and their communication or the use of the name of Retlif Testing Laboratories must receive our prior written approval. Our letters, procedures and reports apply only to the sample tested and are not necessarily indicative of the qualities of apparently identical or similar products. The letters, procedures and reports and the name of Retlif Testing Laboratories or insignia are not to be used under any circumstances in advertising to the general public. This test report shall not be reproduced, except in full, without the written approval of Retlif Testing Laboratories.

Technical Information

Report Number:	R-6201N-1, Rev. A
Customer:	Echelon
Address:	2901 Patrick Henry Drive Santa Clara, CA 95054
Manufacturer:	Echelon
Manufacturer Address:	2901 Patrick Henry Drive Santa Clara, CA 95054
Test Sample:	CRD 3000 Control Router
Part Number:	CRD 3000
Model Number:	76530R
Serial Numbers:	0503F3C3DB00, 0503F3C14500
FCC ID:	IZP76530R
IC:	8093A-76530R
Type:	Digital Transmission – Direct Sequence Spread Spectrum Transmitter
Power Requirements:	120 VAC, 60 Hz
Frequency of Operation:	2405.0 to 2475.0 MHz
Equipment Class:	DTS
Antenna Type:	Flexible Planer Inverted F Antenna, 2 dBi Flexible Polymer Patch Antenna, 4 dBi
Equipment Use:	Wireless Communications Bridge

EUT Operation:

The EUT was operating in two modes. In the first mode, the EUT was transmitting a modulating signal at 2.405 GHz (low channel), 2.440 GHz (mid channel) and 2.475 GHz (high channel). In the second mode, the EUT was in standby.

EUT Description:

The EUT is a bridge between powerline communications and 2.4 GHz radio communications.

Certification and Signatures

We certify that this report is a true representation of the results obtained from the tests of the equipment stated. We further certify that the measurements shown in this report were made in accordance with the procedures indicated and vouch for the qualifications of all Retlif Testing Laboratories personnel taking them.

Scott Wentworth
Branch Manager
NVLAP Approved Signatory

Todd Hannemann
EMC Test Engineer
iNARTE Certified Technician ATL-0255-T

Non-Warranty Provision

The testing services have been performed, findings obtained and reports prepared in accordance with generally accepted laboratory principles and practices. This warranty is in lieu of all others, either expressed or implied.

Non-Endorsement

This test report contains only findings and results arrived at after employing the specific test procedures and standards listed herein. It is not intended to constitute a recommendation, endorsement or certification of the product or material tested. This test report must not be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government.

Revision History

Revisions to this document are listed below; the latest revised document supersedes all previous issues of this document:

Revision	Date	Pages Affected
-	July 14, 2017	Original Release
A	July 18, 2017	Global changes: • Document changed from R-6201N-1 to R-6201N-1, Rev. A 2: • Revised end point value of Frequency of Operation 6: • Revised maximum conducted output power in test results 20-22: • Corrected title and note of all Conducted Output Power test data 26-31: • Added note to all Out of Band Conducted Emissions data 53: • Added Duty Cycle data

Retlif Testing Laboratories

Report No. R-6201N-1, Rev. A

Requirements and Test Results

FCC Section 15.247 (a)(2) and ISSED RSS-247, 5.2(1) - Bandwidth

For systems using digital modulation techniques operating in the 902-928 MHz, 2400-2483.5 MHz, and 5725 – 5850 MHz bands the minimum 6 dB bandwidth shall be at least 500 kHz.

- **Results:**

The minimum 6dB bandwidth measured while transmitting was 1.633 MHz. The device was found to meet the requirement of 15.247 (a)(2) and RSS-247, 5.2(1).

FCC Section 15.247 (b)(3) and ISSED RSS-247, 5.4(4) - Power Output

For systems using digital modulation in the 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz bands: 1 Watt. As an alternative to a peak power measurement, compliance with the one Watt limit can be based on a measurement of the maximum conducted output power. Maximum Conducted Output Power is defined as the total transmit power delivered to all antennas and antenna elements averaged across all symbols in the signaling alphabet when the transmitter is operating at its maximum power control level. Power must be summed across all antennas and antenna elements. The average must not include any time intervals during which the transmitter is off or is transmitting at a reduced power level. If multiple modes of operation are possible (e.g.: alternative modulation methods), the maximum conducted output power is the highest total transmit power occurring in any mode.

- **Results:**

The maximum conducted output power when transmitting was 151.71 mW. The maximum antenna gain of the antenna is 4.0 dBi. The device was found to meet the power output requirements of 15.247 (b)(3) and RSS-247, 5.4 including de facto EIRP.

Retlif Testing Laboratories

Report No. R-6201N-1, Rev. A

Requirements and Test Results (con't)

FCC Section 15.247(d) and ISSED RSS- 247, 5.5 – Unwanted Emissions

Antenna Terminal Out of Band/Band Edge Conducted Emissions

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under Paragraph (b)(3) of Section 15.247 and RSS-247, 5.4(4) the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in Section 15.209(a) and RSS-GEN is not required. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a) and RSS-GEN must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)).

- **Results:**

All measured out of band/band edge conducted emissions were below the specified limits and the device was found to meet the requirements of 15.247 (d).

FCC Section 15.247(d) and ISSED RSS-GEN, 8.9 – Unwanted Emissions

Radiated Spurious Emissions/Restricted Bands/Band Edge

Emissions which fall into restricted bands, as defined in 15.205(a) and RSS-GEN must comply with the radiated emissions limits specified in 15.209(a), RSS-GEN and shown below in Table 3, Antenna-port conducted measurements may also be used as an alternative to radiated measurements for demonstrating compliance in the restricted frequency bands. When conducted measurements are performed in the restricted frequency bands the conducted output power (in dBm) plus the maximum transmit antenna gain (in dBi) must be converted to equivalent electric field strength to be compared to the limits. Emissions emanating from the EUT cabinet and cables must also comply with the radiated emissions limits. Radiated emissions measurements were also performed at the band edges to ensure band edge compliance.

Table 3 - Radiated Emission Limits

Frequency of Emission (MHz)	Field Strength (microvolts/meter)	Measurement Distance (meters)
30 to 88	100	3
88 to 216	150	3
216 to 960	200	3
Above 960	500	3

Retlif Testing Laboratories

Report No. R-6201N-1, Rev. A

Requirements and Test Results (con't)

- **Results:**

All spurious emissions were measured and found to be in compliance with the limits specified in 15.209(a) and RSS-GEN. Band edge emissions were also found to be in compliance with the limits specified in 15.209(a).

Conducted Restricted Bands Field Strength Conversion:

The Conducted Restricted Band Emissions were converted to field strength of the emission as follows:

$$\text{EIRP} = \text{CO} + \text{AG}$$

Where:

CO = Conducted Output Power in dBm

AG = Maximum Transmit Antenna Gain in dBi

$$E = \text{EIRP} - 20\log D + 104.8$$

Where:

E = electric field strength in dB μ V/m,

EIRP = equivalent isotropic radiated power in dBm

D = specified measurement distance in meters.

dB μ V/M is converted to μ V/M for comparison to the specified limit using the formula:

$$\text{invLog dB}\mu\text{V/M}/20$$

Retlif Testing Laboratories

Report No. R-6201N-1, Rev. A

Requirements and Test Results (con't)

FCC Section 15.247(e) and ISSED RSS-247, 5.2(2) – Power Spectral Density

For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission. This power spectral density shall be determined in accordance with the provisions of paragraph (b) of this section. The same method of determining the conducted output power shall be used to determine the power spectral density.

- **Results:**

The power spectral density conducted from the intentional radiator to the antenna was not greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission. This power spectral density was determined in accordance with Section 15.247(b)(3) and RSS-247, 5.2(2).

FCC 15.109 and ISSED RSS-Gen, Par. 7.1 - Receiver Radiated Spurious Emissions

Spurious emissions from receivers must comply with the radiated emissions limits specified in RSS-Gen, Para. 7.1 and as shown above in Table 1.

- **Results:**

No EUT receiver spurious emissions were observed within 10dB of the specified limit.

FCC 15.207(a) and RSS-GEN, Par. 8.8 – AC Conducted Emissions

For an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed the limits shown in Table 4, as measured using a 50 μ H/50 ohms line impedance stabilization network (LISN). Compliance with the provisions of the paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

Table 4 - Conducted Emission Limits

Frequency of Emission (MHz)	Conducted Limit (dB μ V)	
	Quasi-Peak	Average
0.15 to 0.5	66 to 56*	56 to 46*
0.5 to 5	56	46
5 to 30	60	50
*Decreases due to logarithm of the frequency		

- **Results:**

The conducted emissions observed did not exceed the limits specified in Table 4.

Retlif Testing Laboratories

Report No. R-6201N-1, Rev. A

Field Strength Calculation/Conversion:

The maximized field strength of the emission was obtained as follows:

$$CR = MR + CF$$

Where:

CR = Corrected Reading in dB μ V/m

MR = Uncorrected Meter Reading in dB μ V

CF = Correction Factor in dB (Antenna Factor, Pre-amp + Cable Loss)

Example:

$$MR = 15.35 \text{ dB}\mu\text{V}$$

$$CF = 16.85 \text{ dB}$$

$$CR = 15.35 \text{ dB}\mu\text{V} + 16.85 = 32.2 \text{ dB}\mu\text{V/m}$$

dB μ V/M is converted to μ V/M for comparison to the specified limit using the formula:

$$\text{invLog dB}\mu\text{V/M}/20$$

$$32.2 \text{ dB}\mu\text{V/m} = 40.74 \text{ }\mu\text{V/m}$$

RF Power Conversion:

Power readings in dBm may be converted to mW using the formula:

$$\text{InvLog dBm}/10$$

$$\text{Example: } 20\text{dBm} = 100\text{mW}$$

Retlif Testing Laboratories

Report No. R-6201N-1, Rev. A

FCC Section 15.247 (i) and ISSED RSS-102

RF Exposure Limits

Spread Spectrum Transmitters operating under 15.247 and RSS-247 must be operated in a manner that ensures the public is not exposed to RF energy levels in excess of the commission's guidelines. Based on the transmitter power and maximum antenna gain (see calculation below) the minimum separation distance was calculated to determine the distance for acceptable MPE power density levels to meet both the Occupational/Controlled Exposure and the General Population/Uncontrolled Exposure requirements of FCC Part 1.1310 and RSS-102. The calculation below uses the more stringent General Population MPE Limits.

$$S = \frac{PG}{4\pi D^2}$$

D = Minimum Separation Distance in cm

S = Max allowed Power Density in mW/cm²

Per 1.1310 For the Frequency of 2400 MHz S = 1 mW/cm²

Power = Max Power Input to Antenna = 151.71 mW

Gain = Max Power Gain of Antenna = 4.0 dBi = 2.51 numeric

$$1.0 \text{ mW/cm}^2 = \frac{151.71 \times 2.51}{4\pi D^2} = \frac{381.07}{12.56 D^2}$$

$$D^2 = \frac{381.07}{12.56 \times 1.0}$$

$$D = \sqrt{30.33} = 5.51 \text{ cm}$$

RETLIF TESTING LABORATORIES

EMISSIONS TEST DATA SHEET

Test Method	Conducted Emissions, Class B 150 kHz to 30 MHz	
Customer	Echelon	
Job Number	R-6201N-1	
Test Sample	Control Router Device	
Model Number	76530R	
Serial Number	0503F3C3DB00, 0503F3C14500	
Test Specification	FCC Part 15 Subpart B Class B	Paragraph: 15.207 (a)
Operating Mode	Transmitting modulated signal	
Technician	M. Seamans	
Date	May 17 th , 2017	
Port Tested	120 VAC 60 Hz	

Notes: Lead Tested: 120 VAC 60 Hz Neutral Detector: Quasi-Peak and Average

TEST PARAMETERS

Test Frequency	Lead Tested	Quasi-Peak Reading	Quasi-Peak Limit	Quasi-Peak Margin		Average Reading	Average Limit	Average Margin
MHz		dBuV	dBuV	dB		dBuV	dBuV	dB
0.150	-	-	66.0	-		-	56.0	-
	-	-		-		-		-
0.161	Neutral	57.30	65.4	8.14		48.5	55.4	6.9
0.220	Neutral	52.60	62.8	10.22		42.5	52.8	10.3
0.244	Neutral	48.40	62.0	13.58		27.4	52.0	24.6
0.271	Neutral	53.70	61.1	7.39		45.9	51.1	5.2
0.276	Neutral	54.00	60.9	6.94		44.4	50.9	6.5
0.308	Neutral	48.60	60.0	11.42		32.0	50.0	18.0
0.336	Neutral	47.00	59.3	12.30		32.7	49.3	16.6
0.436	Neutral	37.80	57.1	19.34		27.8	47.1	19.3
	-	-		-		-		-
0.500	-	-	56.0	-		-	46.0	-
