TEST REPORT

Report No.: Z01C-01134

Issue Date: March 30, 2001

The device, as described herewith, was tested pursuant to applicable test procedure indicated below and complies with the requirements of;

FCC Part15 Subpart B, Class B

The EUT complies with section 15.37 "Transition provision for compliance with the rules".

The test results are traceable to international or national standards.

Applicant	: Sanyo Electric Co., Ltd. Information Products Division 1-1-1, Sakata, Oizumi-machi Ora-gun , Gunma-ken 370-0596 Phone: +81-276-61-8006 Fax.: +81-276-61-8752
Equipment under test (EUT)	: CD-RW Drive
FCC ID	: JBQCDR022
Trade Name	: SANYO
Model Number	: CRD-BP1500P
Serial Number	: PP091
EUT Condition	: Pre-production

Test procedure	: ANSI C63.4-1992
Date of test	: March 27, 28, 2001
Test place	: Site 3
Test results	: Complied

Zacta Technology Corporation certifies that no party to the application is subject to a denial of federal benefits, that include FCC benefits, pursuant to Section 5301 of the Anti-Drug Abuse Act of 1988, 21U.S.C. 853(a).

The results in this report are applicable only to the samples tested.

This report shall not be re-produced except in full without the written approval of ZACTA Technology Corporation.

Test performed by: Takuya Osato / EMC engineer

Authorized by: Kiyoshi Endo / Manager of Technical Division

Note 1: Numbers assigned to equipment or cables on this diagram are corresponded to the list in "1.1 EUT information", "2.1 Peripheral(s) information" and "2.2 Cable(s) information".

Note 2: Display is certified with the molded ferrite core on cable (No. h). I/F cable is Un-detachable and ferrite core is not added during testing

3. Test procedure

3.1 Description of Conducted Emission testing

Conducted emission testing is performed using test receiver. The detector function of the receiver is set to CISPR quasi-peak mode and the bandwidth is set to 9kHz. The frequency range from 450kHz to 30 MHz is scanned, and six highest emissions (Min.) are reported. The test results represent the worst-case emission for each emission with manipulating the EUT, support equipment, interconnecting cables and varying the mode of operation.

EUT and support equipment is on a 1 meter x 1.5 meter surface, 0.8-meter height wooden table that is placed 40 cm away from the vertical metal ground plane.

Conducted emission of Host PC was tested because EUT is powered from Host PC. 50 Ω /50uH Line Impedance Stabilization Network (LISN) are 80cm away from the Host PC and placed on the conducting ground plane. LISN for peripheral is terminated in 50 Ω .

Sufficient time for the EUT, support equipment and test equipment are allowed in order for them to warm up to their normal operating condition.

3.3 Description of Radiated emission testing

Radiated emission testing is performed at 3m distance using broadband antenna (Biconical antenna, log-periodic antenna and double-ridged guide antenna). The antenna is positioned both the horizontal and vertical planes of polarization and height is varied 1 to 4 meters and stopped at height producing the maximum emission. Frequency Range: 30MHz –1GHz is scanned and investigated using receiver, and above 1GHz, using spectrum analyzer. The detector function of the test receiver is set to CISPR Quasi-peak mode and the bandwidth is set to 120kHz. Peak and average detectors are used for measurements above 1GHz. The bandwidth of spectrum analyzer is set to 1MHz.

The EUT and support equipment are placed on a 1 meter x 1.5 meter surface, 0.8 meter height wooden table. The turntable is rotated by 360 degrees and stopped at azimuth of producing the maximum emission.

Interconnecting cables, which hanging closer than 40cm to the horizontal metal ground plane are bundled its excess in center. Six highest emissions (Min.) are reported. The test results represent the worst-case emission for each emission with manipulating the EUT, support equipment, interconnecting cables and varying the mode of operation.

Sufficient time for the EUT, support equipment, and test equipment are allowed in order for them to warm up to their normal operating condition.

The highest frequency used in the EUT is 310MHz, therefore, the frequency range is investigated from 30MHz up to the frequency 2GHz, as specified in CFR section 15.33.

$\pm 4.26\text{dB}$	• • • For 10m Radiated Emission

Judgment of Uncertainty under the measurement data and the scope of permission

Example A	Example B	Example C	Example D
			
Judgment: Complied	Judgment: Complied	Judgment: Not complied	Judgment: Not complied
The result of measurement is compliance with the limit in 95% or more confidence probability.	The result of measurement is compliance with the limit with less extent of uncertainty of the measurement. It is impossible to consider it complies with the limit in 95% confidence probability, but the result satisfies the limit in high probability.	The result of measurement is not compliance with the limit with less extent of uncertainty of the measurement. It is impossible to consider it complies with the limit in 95% confidence probability, but the result does not satisfy the limit in high probability.	The result of measurement is not compliance with the limit.

5. Results of the measurements

5.1 Results of the measurements

The minimum margins to the limits are as follows.

Conducted emission	Margin	Frequency	Detector	Operating mode	Data sheet
	8.4dB	0.482MHz	Quasi-peak	CD Read mode	No. 2

Radiated emission	Margin	Frequency	Antenna Polarity	Antenna Height	Table degree	Operating mode	Data sheet
	2.8dB	569.22MHz	Vertical	1.0m	15°	CD Read mode	No. 4

5.2 Deviation from the standard

Not applicable.

5.3 Sample of field strength calculation
