

CONDUCTED HARMONIC EMISSIONS MEASUREMENTS

Agilent 16:55:01 May 19, 2004

The power transmitted here is 1 Watt. This measurement was taken at the antenna port of the FR filter. The RF filter has at least 90 dB of rejection at the second harmonic. We had to notch the fundamental frequency to make this measurement but we did not affect the harmonics. I think this is all of the tests you requested. If I left out anything just let me know.

Thanks
