

07/06/2021

Lutron Electronics Co., Inc.
7200 Suter Road
Coopersburg, PA 18036

Dear Keith Kennedy,

Enclosed is the Wireless test report for compliance testing of the Lutron Electronics Co., Inc., x96 as tested to the requirements of Title 47 of the CFR, Ch. 1 (10-1-06 ed.), Part 15 Subpart C for Intentional Radiators.

Thank you for using the services of Eurofins Electrical and Electronic Testing NA, Inc. If you have any questions regarding these results or if we can be of further service to you, please feel free to contact me.

Sincerely yours,
EUROFINS ELECTRICAL AND ELECTRONIC TESTING NA, INC.

A handwritten signature in blue ink that reads "Joel Huna".

Joel Huna
Documentation Department

Certificates and reports shall not be reproduced except in full, without the written permission of Eurofins Electrical and Electronic Testing NA, Inc. While use of the A2LA logo in this report reflects Eurofins Electrical and Electronic Testing NA, Inc. accreditation under these programs, the report must not be used by the client to claim product certification, approval, or endorsement by A2LA, or any agency of the Federal Government. This letter of transmittal is not a part of the attached report.

Eurofins Electrical and Electronic Testing NA, Inc. is part of the Eurofins Electrical & Electronics (E&E) global compliance network.

Electromagnetic Compatibility Criteria Test Report

for the

**Lutron Electronics Co., Inc.
x96**

Tested under
the FCC Certification Rules
contained in
15.247 Subpart C for Intentional Radiators

Report: WIR112138A-FCC247 BLE Rev. 2

07/06/2021

Prepared For:

**Lutron Electronics Co., Inc.
7200 Suter Road
Coopersburg, PA 18036**

Prepared By:
Eurofins Electrical and Electronic Testing NA, Inc.
914 West Patapco Avenue, Baltimore, MD 21230

Electromagnetic Compatibility Criteria Test Report

for the

Lutron Electronics Co., Inc.
x96

Tested under
the FCC Certification Rules
contained in
15.247 Subpart C for Intentional Radiators

Deepak Giri, Project Engineer
Electromagnetic Compatibility Lab

Engineering Statement: The measurements shown in this report were made in accordance with the procedures indicated, and the emissions from this equipment were found to be within the limits applicable. I assume full responsibility for the accuracy and completeness of these measurements, and for the qualifications of all persons taking them. It is further stated that upon the basis of the measurements made, the equipment tested is capable of operation in accordance with the requirements of the FCC Rules Part 15.247 under normal use and maintenance.

Steve Pitta,
Director, Electromagnetic Compatibility Lab

Executive Summary

A. Purpose of Test

An EMC evaluation was performed to determine compliance of the Lutron Electronics Co., Inc. x96, with the requirements of Part 15, §15.247. All references are to the most current version of Title 47 of the Code of Federal Regulations in effect. In accordance with §2.1033, the following data is presented in support of the Certification of the x96. Lutron Electronics Co., Inc. should retain a copy of this document which should be kept on file for at least two years after the manufacturing of the x96, has been **permanently** discontinued.

B. Executive Summary

The following tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with Part 15, §15.247, in accordance with Lutron Electronics Co., Inc., quote number 3LUT2002R1. All tests were conducted using measurement procedure ANSI C63.10-2013.

FCC Reference 47 CFR Part 15.247:2005	Description	Compliance
Title 47 of the CFR, Part 15 §15.203	Antenna Requirement	Compliant

Table 1: Executive Summary of EMC Part 15.247 Compliance Testing

Equipment Configuration

A. Overview

Eurofins Electrical and Electronic Testing NA, Inc. was contracted by Lutron Electronics Co., Inc. to perform testing on the x96, under Lutron Electronics Co., Inc.'s quote number 3LUT2002R1,

This document describes the test setups, test methods, required test equipment, and the test limit criteria used to perform compliance testing of the Lutron Electronics Co., Inc., x96.

The results obtained relate only to the item(s) tested.

Model(s) Tested:	x96	
Model(s) Covered:	x96	
EUT Specifications:	Primary Power: 120 – 277 VAC	
	FCC ID: JPZ0133	
	Type of Modulations:	GFSK
	Equipment Code:	DTS
	Peak RF Output Power:	19.11 dBm
	EUT Frequency Ranges:	2402-2480 MHz
	Transmit Speeds:	1Mbps & 2 Mbps for BLE
	Antenna Type:	PIFA on the PCB
	Antenna Gain:	0 dBi
	Firmware Version:	N/A
Analysis:	The results obtained relate only to the item(s) tested.	
Environmental Test Conditions:	Temperature: 15-35° C	
	Relative Humidity: 30-60%	
	Barometric Pressure: 860-1060 mbar	
Evaluated by:	Deepak Giri	
Report Date(s):	07/06/2021	

Table 2: EUT Summary Table

C. Test Site

All testing was performed at Eurofins Electrical and Electronic Testing NA, Inc., 914 West Patapasco Avenue, Baltimore, MD 21230. All equipment used in making physical determinations is accurate and bears recent traceability to the National Institute of Standards and Technology.

Radiated Emissions measurements were performed in a 3 meter semi-anechoic chamber (equivalent to an Open Area Test Site). In accordance with §2.948(a)(3), a complete site description is contained at Eurofins Electrical and Electronic Testing NA, Inc.

D. Measurement Uncertainty

Test Method	Typical Expanded Uncertainty	K	Confidence Level
Radiated Emissions, (30 MHz – 1 GHz)	±3.20	2	95%
Radiated Emissions, (1 GHz – 6 GHz)	±2.52	2	95%
Conducted Emission Voltage	±2.03	2	95%
RF Frequencies	±4.52 Hz	2	95%
RF Power Conducted Emissions	±2.32 dB	2	95%
RF Power Conducted Spurious Emissions	±2.25 dB	2	95%
RF Power Radiated Emissions	±3.01 dB	2	95%

Table 3: Uncertainty Calculations Summary

E. Description of Test Sample

The x96, Equipment Under Test (EUT), is a load controller with integrated wireless communication and low voltage output. The EUT contains an RF transceiver and an antenna that cannot be changed by the user. The purpose of wireless communication is to receive commands and transmit status back to the control system. The x96 runs on 120V or 277V AC inputs and outputs 21VDC and RS485 control signals. The x96 mounts on a wall using a junction box.

Model tested was HW-X96, and this device is identical in construction to HW-X96-X-J1 and CM-X96-J1.

x96 – Block Diagram of Test Configuration

Figure 2: Block Diagram of Test Configuration

F. Equipment Configuration

The EUT was set up as outlined in **Figure 2**. All cards, racks, etc., incorporated as part of the EUT is included in the following list.

Ref. ID	Slot #	Name / Description	Model Number	Part Number	Serial Number	Rev. #
	Conducted sample	LED Controller	HW-X96			
	Radiated sample	LED Controller	HW-X96			

Table 4: Equipment List

The firmware installed in the EUT during testing was App 1.1.1d0.

G. Support Equipment

Ref. ID	Name/Description	Manufacturer	Model Number	*Customer Supplied Calibration Data
N/A	2.4GHz Dongle	NCD Communications	N/A	N/A

Support Equipment

H. Ports and Cabling Information

Ref. ID	Port Name on EUT	Cable Desc. or reason for none	QTY	Length as tested (m)	Max Length (m)	Shielded?	Termination Box ID & Port Name
N/A	Power	18AWG min	1	1	N/A	No	Black-Hot, Silver-Neutral, Green-Ground
N/A	Output	Lutron QS Cable (power and communication)	1	10	15	No	Load

Ports and Cabling

I. Mode of Operation

a) While powering a load, the device is in radio stand by mode awaiting commands b) Transmitting

J. Method of Monitoring EUT Operation

Transmissions can be captured on a spectrum analyzer. The device draws power from the AC input at all times.

K. Modifications

a) Modifications to EUT

No modifications were made to the EUT.

b) Modifications to Test Standard

No modifications were made to the test standard.

L. Disposition of EUT

The test sample including all support equipment submitted to the Electro-Magnetic Compatibility Lab for testing was returned to Lutron Electronics Co., Inc. upon completion of testing.

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 15.203 Antenna Requirement

Test Requirement: § 15.203: An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.

The structure and application of the EUT were analyzed to determine compliance with Section 15.203 of the Rules. Section 15.203 states that the subject device must meet at least one of the following criteria:

- a.) Antenna must be permanently attached to the unit.
- b.) Antenna must use a unique type of connector to attach to the EUT.
- c.) Unit must be professionally installed. Installer shall be responsible for verifying that the correct antenna is employed with the unit.

Test Results: The EUT as tested is **compliant** with § 15.203 Antenna Requirement. As per 15.203, antenna is permanently attached which satisfies the requirement.

Test Engineer: Deepak Giri

Test Date: 04/26/2021

Gain	Type	Model	Manufacturer
0 dBi	PIFA on the PCB	N/A	N/A

Table 5. Antenna List

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 15.207(a) Conducted Emissions Limits

Test Requirement(s): § 15.207 (a): For an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30MHz, shall not exceed the limits in the following table, as measured using a 50 μ H/50 Ω line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

Frequency range (MHz)	§ 15.207(a), Conducted Limit (dB μ V)	
	Quasi-Peak	Average
* 0.15- 0.5	66 - 56	56 - 46
0.5 - 5	56	46
5 - 30	60	50

Table 6: Conducted Limits for Intentional Radiators from FCC Part 15 § 15.207(a)

Test Procedure: The EUT was placed on a 0.8 m-high wooden table inside a screen room. The EUT was situated such that the back of the EUT was 0.4 m from one wall of the vertical ground plane, and the remaining sides of the EUT were no closer than 0.8 m from any other conductive surface. The EUT was powered from a 50 Ω /50 μ H Line Impedance Stabilization Network (LISN). The EMC receiver scanned the frequency range from 150 kHz to 30 MHz. Conducted Emissions measurements were made in accordance with ANSI C63.4-2014 "Methods and Measurements of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9kHz to 40 GHz". The measurements were performed over the frequency range of 0.15 MHz to 30 MHz using a 50 Ω /50 μ H LISN as the input transducer to an EMC/field intensity meter. For the purpose of this testing, the transmitter was turned on. Scans were performed with the transmitter on.

Test Results: The EUT as tested is **compliant** with § 15.207(a) Conducted Emissions Limits.

Test Engineer: Deepak Giri

Test Date: 04/26/2021

Table 10. Conducted Emissions, 2 Mbit, 120 VAC, Neutral, Test Results

Note 1: * - At this frequency, the measured electric-field strength exhibits a margin of compliance that is less than 3 dB below the specification limit. We recommend that every emission measured, have at least a 3 dB margin to allow for deviations in the emission characteristics that may occur during the production process.

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 15.247(a)(2) 6 dB Bandwidth

Test Requirements: § 15.247(a)(2): Operation under the provisions of this section is limited to frequency hopping and digitally modulated intentional radiators that comply with the following provisions:

For systems using digital modulation techniques, the EUT may operate in the 902-928 MHz, 2400-2483.5 MHz and 5725-5850 MHz bands. The minimum 6dB bandwidth shall be at least 500 kHz.

Test Procedure: The transmitter was on and transmitting at the highest output power. The bandwidth of the fundamental frequency was measured with the spectrum analyzer using a RBW = 100kHz, VBW = 3*RBW. The 6 dB Bandwidth was measured and recorded. The measurements were performed on the low, mid and high channels.

Figure 12. Block Diagram, Occupied Bandwidth Test Setup

Test Results: The EUT as tested is **compliant** with § 15.247(a)(2) 6 dB Bandwidth.

The 6 dB Bandwidth was determined from the plots on the following pages.

Test Engineer: Deepak Giri

Test Date: 04/26/2021

Occupied Bandwidth 1MBit		
Carrier Channel	Frequency (MHz)	Measured 6dB Bandwidth (MHz)
Low	2402	0.723
Mid	2444	0.715
High	2480	0.717
Occupied Bandwidth 2MBit		
Carrier Channel	Frequency (MHz)	Measured 6dB Bandwidth (MHz)
Low	2402	1.38
Mid	2444	1.38
High	2480	1.38

Electromagnetic Compatibility Criteria for Intentional Radiators

Duty Cycle

Test Procedure: The EUT was connected to a spectrum analyzer and was ran at the maximum achievable duty cycle for all modes. The duty cycle was measured in accordance with section 11.6 of ANSI C63.10-2013. The unit tested did not have a duty cycle but a duty cycle was used for restricted band measurements and provided by Lutron.

Test Engineer(s): Deepak Giri

Test Date(s): 04/26/2021

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 15.247(b) Peak Power Output

Test Requirements: §15.247(b): The maximum peak output power of the intentional radiator shall not exceed the following:

Digital Transmission Systems (MHz)	Output Limit (Watts)
2400–2483.5	1.000

Figure 25: Output Power Requirements from §15.247(b)

§15.247(c): if transmitting antennas of directional gain greater than 6 dBi are used the peak output power from the intentional radiator shall be reduced below the stated values in the 9, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

Test Procedure: The EUT was configured to measure the low, mid and high channels of each band at the maximum power level. Measurements were performed in a conducted setup as shown in figure below.

Figure 26. Power Output Test Setup

Test Results: The EUT as tested is **compliant** with § 15.247(b) Peak Power Output.

Test Engineer: Deepak Giri

Test Date: 04/26/2021

Table 17: Restricted Bands of Operation

¹ Until February 1, 1999, this restricted band shall be 0.490 – 0.510 MHz.

² Above 38.6

Test Requirement(s): § 15.209 (a): Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in Table 18:

Frequency (MHz)	§ 15.209(a), Radiated Emission Limits (dBμV) @ 3m
30 - 88	40.00
88 - 216	43.50
216 - 960	46.00
Above 960	54.00

Table 18: Radiated Emissions Limits Calculated from FCC Part 15, § 15.209 (a)

Test Procedures: The transmitter was turned on. Measurements were performed of the low, mid and high Channels. The EUT was rotated orthogonally through all three axes. Plots shown are corrected for both antenna correction factor and distance and compared to a 3 m limit line. Only noise floor was measured above 18 GHz.

Figure 33: Radiated Emissions Test Setup

Test Results:

The EUT as tested is **compliant** with § 15.209 Radiated Spurious Emissions Requirements and Band Edge. Protocol limited duty cycle (40%) correction were applied to obtain the final Average measurement on emissions associated with fundamental. Radiated cabinet emissions were measured using 50Ohm terminator at EUT antenna terminal. Emissions were measured from 30MHz-25GHz. Pre-amplifier was used in 18-25GHz measurement.

Emission close to the limit line were re-evaluated using appropriate detector and test method.

Plots presented are cumulative results of 3 orthogonal EUT positions.

Test Engineer:

Deepak Giri

Test Date:

Radiated Band Edge Measurements

Test Procedures:

The transmitter was turned on. Measurements were performed of the low and high Channels. The EUT was rotated orthogonally through all three axes. Plots shown are corrected for both antenna correction factor and distance and compared to a 3 m limit line. Protocol limited duty cycle (40%) correction were applied to obtain the final Average measurement on emissions associated with fundamental. Restricted band emissions were measured using conducted test method defined in 11.12.2, 11.12.2.2, 11.12.2.4 and 11.12.2.5.3. Restricted band edges were measured without in-band notch filter. Out of band restricted emissions were measured using In-band notch filter.

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 15.247(d) 20 dBc Emissions

Test Requirement: **15.247(d)** In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB.

Test Procedure: For intentional radiators with a digital device portion which operates below 10 GHz, the spectrum was investigated as per §15.33(a)(1) and §15.33(a)(4); i.e., the lowest RF signal generated or used in the device up to the 10th harmonic of the highest fundamental frequency or to 40 GHz, whichever is lower.

Conducted measurements were performed. The plots were corrected for cable loss.

Figure 71: Block Diagram, 20 dBc Emissions Test Setup

Test Results: The EUT was tested is **compliant** with § 15.247(d) 20 dBc Emissions.

Test Engineer: Deepak Giri

Test Date: 04/26/2021

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 15.247(e) Peak Power Spectral Density

Test Requirements: §15.247(e): For digitally modulated systems, the peak conducted from the intentional radiator to the antenna shall not be greater than 8dBm in any 3 kHz band during any time interval of continuous transmission.

Test Procedure: The power level was set to the maximum level throughout each of the 100 sweeps of power averaging. The RBW was set to 100 kHz and a VBW set to 300 kHz or greater. The spectrum analyzer was set to an auto sweep time and a peak detector was used. Measurements were carried out at the low, mid and high channels.

Figure 88: Block Diagram, Power Spectral Density Test Setup

Test Results: The EUT was tested is **compliant** with § 15.247(e) Peak Power Spectral Density.

The peak was determined from plots on the following page(s).

Test Engineer: Deepak Giri

Test Date: 04/26/2021

Carrier Channel	Data Rate	Frequency (MHz)	Conducted PSD (dBm)	Antenna Gain (dBi)	Limit (dBm)	Margin (dB)
Low	1MBit	2402	3.31	0	8	-4.69
Mid	1Mbit	2444	3.28	0	8	-4.72
High	1Mbit	2480	3.16	0	8	-4.84
Low	2MBit	2402	-0.63	0	8	-8.63
Mid	2MBit	2444	-0.76	0	8	-8.76
High	2MBit	2480	-2.1	0	8	-10.1

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 15.247(i) RF Human Exposure

RF Exposure

Requirements:

§1.1307(b)(1) and §1.1307(b)(2): Systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy levels in excess of the Commission's guidelines.

RF Radiation

Exposure Limit:

§2.1093: As specified in this section, a portable device is defined as a transmitting device designed to be used so that the radiated structure(s) of the device is within 20 centimeters of the body of the user. Calculations below are in accordance with KDB 447498 D01 General RF Exposure Guidance v06, Section 4.3 General SAR test exclusion guidance. The SAR test exclusion thresholds are 3.0 for 1-g SAR and 7.5 for 10-g extremity SAR.

Test Results:

The EUT was tested is **compliant** with § 15.247(i) Maximum Permissible Exposure.
