	T _L =lower Temperature	-15 °C
	V _H =higher Voltage	DC 16.50V
	T _H =higher Temperature	55 °C

Note:

Unless otherwise stated the extreme tests conditions means that the Equipment Under Test (EUT) shall be tested

at the upper temperature (T_H) and at the upper limit of the supply voltage (V_H) applied simultaneously, and at the low temperature (T_L) and the lower limit of the supply voltage (V_L) applied simultaneously.

4.6. Measurement uncertainty

Test Items	Measurement Uncertainty
RF frequency	15Hz for <1GHz 70Hz for >1GHz
RF power	0.51dB
Maximum frequency deviation: within 300 Hz to 6 kHz of modulation frequency	2.6 %
Deviation limitation	3.5 %
Adjacent channel power	0.72dB
Conducted spurious emission	0.51dB
Audio output power	0.25 dB
Amplitude characteristics of receiver limiter	1.20 dB
Sensitivity at 20 dB SINAD	2.60 dB
Two-signal measurement	2.80 dB
Three-signal measurement	2.20 dB
Radiated emission	2.66dB for <1GHz 3.44dB for >1GHz
Transmitter transient time	6.8 %
Transmitter transient frequency	75 Hz
Receiver desensitization (duplex operation)	0.25 dB

This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=1.96.

5.2. Transmitter Requirement

5.2.1. Frequency error

The frequency error is the difference between the measured carrier frequency and its nominal value.

LIMIT

IEC 62238 Sub-clause 8.1.3

The frequency error shall be within $\pm 1,5$ kHz.

5.2.2. Carrier Power (Conducted)

The carrier power is the mean power delivered to the artificial antenna during one radio frequency cycle in the absence of modulation. The rated output power is the carrier power declared by the manufacturer.

LIMIT

IEC 62238 Sub-clause 8.2.3

Normal test conditions:

The rated output power of the equipment shall be between 6 W and 25 W.

With the output power switch set at maximum, the carrier power shall be within $\pm 1,5$ dB of the rated output power under normal test conditions. The output power shall never however exceed 25 W.

With the output power switch set at minimum the carrier power shall remain between 0,1 W and 1 W.

The maximum continuous transmission time shall be between 5 min and 6 min.

Extreme test conditions:

With the output power switch set at maximum, the carrier power shall remain between 6 W and 25 W and be within +2 dB, -3 dB of the rated output power under extreme conditions. The output power shall never however exceed 25 W.

With the output power switch set at minimum the carrier power shall remain between 0,1 W and 1 W.

The maximum continuous transmission time shall be between 5 min and 6 min.

5.2.3. Frequency Deviation

For the purpose of the present document, the frequency deviation is the difference between the instantaneous frequency of the modulated radio frequency signal and the carrier frequency.

LIMIT

IEC 62238 Sub-clause 8.3.2

Maximum permissible frequency deviation:

The maximum frequency deviation shall be ± 5 kHz.

IEC 62238 Sub-clause 8.3.3

For modulation frequencies between 3 kHz and 6 kHz the frequency deviation shall not exceed the frequency deviation with a modulation frequency of 3 kHz. For a modulation frequency of 6 kHz, the frequency deviation shall not exceed $\pm 1,5$ kHz, as shown in Figure 1.

For modulation frequencies between 6 kHz and 25 kHz, the frequency deviation shall not exceed that given by a linear response of frequency deviation (in dB) against modulation frequency, starting at the point where the modulation frequency is 6 kHz and the frequency deviation is $\pm 1,5$ kHz and inclined at 14 dB/octave, with the frequency deviation diminishing as the modulation frequency increases, as shown in Figure 1 as far as practicable.

5.2.4. Sensitivity of the modulator, including microphone

This characteristic expresses the capability of the transmitter to produce sufficient modulation when an audio frequency signal corresponding to the normal mean speech level is applied to the microphone.

LIMIT

IEC 62238 Sub-clause 8.4.3

The resulting frequency deviation shall be between $\pm 2,5$ kHz and ± 4.5 kHz.

5.2.5. Audio frequency response

The audio frequency response is the frequency deviation of the transmitter as a function of the modulating frequency.

LIMIT

IEC 62238 Sub-clause 8.5.3

The audio frequency response shall be within +1 dB and -3 dB of a 6 dB/octave line passing through the reference point (see figure 2).

5.2.6. Audio frequency harmonic distortion of the emission

The harmonic distortion of the emission modulated by an audio frequency signal is defined as the ratio, expressed as a percentage, of the root mean square (rms) voltage of all the harmonic components of the fundamental modulation frequency to the total rms voltage of the modulation signal after linear demodulation

LIMIT

IEC 62238 Sub-clause 8.6.3

The harmonic distortion shall not exceed 10%.

5.2.7. Adjacent Channel Power

The adjacent channel power is that part of the total power output of a transmitter under defined conditions of modulation, which falls within a specified passband centred on the nominal frequency of either of the adjacent channels. This power is the sum of the mean power produced by the modulation, hum and noise of the transmitter.

LIMIT

IEC 62238 Sub-clause 8.7.3

The adjacent channel power shall not exceed a value of:
