Engineer: Greg Corbin

Test Date: 3/19/2025

Measurement Procedure

The Equipment Under Test (EUT) was connected to a spectrum analyzer through a 30 dB Power attenuator. All cable and attenuator losses were input into the spectrum analyzer as a reference level offset to ensure accurate readings were obtained.

CW output power was recorded with peak detector set to max hold.

Manufacturer Rated Power =VHF= 6 watts (37.782 dBm)

Manufacturer Rated Power =UHF= 5 watts (36.99 dBm)

Manufacturer Rated Power =700 band= 3 watts (34.771 dBm)

Manufacturer Rated Power =800 band= 3 watts (34.771 dBm)

ISED RSS-119 Output Power Limit = ± 1 dB of manufacturer rated power.

FCC Output Power Limit = 7.2 w (20% of manufacturer rated power)

Conducted Spurious Emissions

Engineer: Greg Corbin

Test Date: 3/19/20225

Test Procedure

The EUT was connected directly to a spectrum analyzer to verify that the EUT met the requirements for spurious emissions. The resolution bandwidth set for 100 kHz or 1 MHz as required per the rule section and the reference level was adjusted to ensure the system had sufficient dynamic range to measure spurious emissions.

The frequency range from 30 MHz to the 10th harmonic of the fundamental transmitter was observed and plotted.

The conducted spurious emissions were recorded for CW and C4FM modes of operation.

The specification limit was set for -20 dBm for comparison to the emission mask “D” limit.

Note: A marker was placed on the fundamental frequency and the highest spurious emission.

For 30 – 1000 MHz, a Peak detector set to max hold was used.

For 1 – 10 GHz an Average detector was used.

The # of trace points was set to 64000.

Field Strength of Spurious Radiation

Engineer: Greg Corbin

Test Date: 2/21/2023

Test Procedure

The EUT was tested in a semi-anechoic chamber with the turntable set 3m from the receiving antenna. A spectrum analyzer was used to verify that the EUT met the requirements for Radiated Emissions. The EUT was tested by rotating it 360 degrees with the receive antenna in both the vertical and horizontal orientation while raised from 1 to 4 meters to ensure that the signal levels were maximized. All cable and antenna correction factors were input into the spectrum analyzer ensuring an accurate measurement in ERP/EIRP with the resultant power in dBm.

The EUT was set to transmit at maximum power with the RF output terminated in 50 ohms.

Radiated spurious emissions was recorded with the EUT in CW mode and C4FM.

Note: A marker was placed on the fundamental frequency and the highest spurious emission.

The RBW was set to 100 kHz for measurements below 1 GHz and 1 MHz for measurements above 1 GHz. The VBW was set to 3 times the RBW.

A peak detector set to max hold was used.

The following formula was used for calculating the limits:

For the VHF, UHF, 800 MHz band the radiated spurious limit = $P_1 - (50 + 10\log(P_2)) = -20\text{dBm}$
