GENERAL INFORMATION

DESCRIPTION OF MEASUREMENT FACILITIES:

A description of the measurement facilities was filed with the Commission and was found to be in compliance with requirements of Section 2.948, by letter dated October 21, 1996. All pertinent changes will be reported to the Commission by an up-date.

IDENTIFICATION OF AN AUTHORIZED DEVICE:

2.1033

Test and Measurement Data

All tests and measurement data shown were performed in accordance with FCC Rules and Regulations, Volume II; Part 2, Sub Part J, sections 2.1033, 2.1035, 2.1041, 2.1043, 2.1045 and the following individual Parts:

15.247: Operation within the bands 902-928MHz, 2400-2483.5MHz and 5725-5850MHz (Spread Spectrum)

EESI'S TEST EQUIPMENT & TEST FACILITIES CALIBRATION PROGRAM

EESI operates a comprehensive equipment calibration program in order to ensure the validity of all test data. EESI's calibration program is fully compliant to the requirements of ANSI/NCSL Z540-1 (1994) and of ISO 10012-1 (1993-05-01). EESI's calibration program therefore meets or exceeds the US national commercial and military requirements (N.B. ANSI/NCSL Z540-1 (1994) replaces MIL-STD-45662A) and meets the requirements of ISO-9000. Specifically, all of EESI's *primary reference standard devices* (e.g., resistor and capacitor decade boxes, vector voltmeters, multimeters, attenuators and terminations, RF power meters (and their detector heads), oscilloscope mainframes and plug-ins, spectrum analyzers, RF preselectors, quasi-peak adapters, interference analyzers, impulse generators, signal generators and pulse/function generators, etc.) and certain *secondary standard devices* (e.g., RF preamplifiers used in CISPR 11/22 and FCC Part 15/18 tests) are calibrated by EESI-approved independent (third party) metrology laboratories, using NIST-traceable standards. In all cases, the metrology laboratory furnishes EESI with Certificates of Calibration on each item of equipment that has been successfully recalibrated.

Calibration intervals are normally one year, except when the manufacturer advises a shorter interval (e.g., the HP 8568B Spectrum Analyzer is recalibrated every 6 months) or if US Government directives demand a shorter interval (e.g., the Eaton 533X-11 Impulse Generator is required to be recalibrated every six months for use in TEMPEST testing). Items of equipment which fail during routine use, or which suffer visible mechanical damage (during use or while in transit), are sidelined pending repair and recalibration. (Repairs are carried out either by the EESI-approved independent (third party) metrology laboratories, or by the manufacturer of the equipment.

EESI typically determines the Antenna Factors in its test antennas in-house. Antennas used for CISPR 11, CISPR 22 and FCC Part 15 and Part 18 Radiated Emissions testing (and for testing to the European Norms) are calibrated against NIST-traceable, FCC-approved RobertsTM Dipoles, using the methods specified in both Annex G.5 of CISPR 16-1 (1993) and ANSI C63.5 (1991), including the "Three-Antenna Method." Certain other antennas (e.g., log-conic spirals) are calibrated using the procedures specified in SAE ARP-958A. In accordance with FCC regulations, EESI recalibrates its suite of antennas used for FCC tests on an annual basis. These calibrations are performed as a precursor to the FCC-required annual revalidation of the *Normalized Site Attenuation* properties of EESI's Open Area Test Site¹. In those instances where antennas are acquired directly from the manufacturer, EESI will purchase and Antenna Factor Calibration Data Package. Finally, EESI may send antennas out to NIST-traceable/military-approved independent antenna range laboratories, or to the original equipment manufacturer.

¹ EESI uses the procedures contained in both Subclause 16.6 and Annex G.2 of CISPR 16-1 (1993), and ANSI C63.4 (1992) when performing Normalized Site Attenuation measurement for calibration of EESI's Open Area Test Site.

OUT OF BAND EMISSIONS

MEASUREMENT PROCEDURE:

At first, bench tests were performed to locate the emissions at the antenna terminals.

In the field, tests were conducted over the range shown. The test sample was set up on a wooden turntable above ground, and at a distance of three meters from the antenna connected to the spectrum analyzer.

In order to obtain the maximum response at each frequency, the turntable was rotated, and the search antenna was raised and lowered. The E.U.T. was also adjusted for maximum response.

Name of Test: Out of Band Emissions
Paragraph: 15.109, 15.205
Test Conditions: Standard Temperature and Humidity
Spec. Limit: See Below
Test Equipment: As per previous page

Search Antennas:

30 KHz - 200 MHz:	EMCO 3146
200 MHz - 1 GHz	EMCO 1412
1 GHz - 10 GHz	EMCO 3115

Limit

In any 100kHz bandwidth outside these frequency bands, radio frequency power that is produced by the modulation products of the spreading sequence, information sequence, and the carrier frequency shall be either

at least 20dB below that in any 100kHz bandwidth within the band that contains the highest level of the desired power

or

shall not exceed the general levels specified in 15.209(a),
whichever results in the lesser attenuation.

All other emissions outside these bands shall not exceed the general radiated emission limits specified in 15.209(a).

Measurement Procedure:

At first, bench tests were performed to locate the emissions at the antenna terminals.

In the field, tests were conducted over the range shown. The test sample was set up on a wooden turntable above ground, and at a distance of three meters from the antenna connected to the spectrum analyzer.

In order to obtain the maximum response at each frequency, the turntable was rotated, and the search antenna was raised and lowered. The E.U.T. was also adjusted for maximum response.

The field strength was calculated from:

$$E \text{ } \mu\text{V/m @ 3m} = \text{LOG}_{10}^{-1} (\text{dBm} + 107 + \text{A.F.} + \text{C.L.})$$

20

The following results are worst case conditions. Tests were conducted in Horizontal & Vertical polarization modes. Measurement Results: Attached

Introduction

As required in 47 CFR, Parts 2 and 15, the methods employed to test the radiated and conducted emissions (as applicable) of the EUT are those contained within the American National Standards Institute (ANSI) document C63.4-1992, titled "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the range of 9 kHz to 40GHz." All applicable FCC Rule Sections which provide further guidance for performance of such testing are also observed.

Configuration and Methods of Measurements for Conducted Emissions

Section 7 of ANSI C63.4 determines the general configuration of the EUT and associated equipment, as well as the test platform for conducted emissions testing. Table-top devices are placed on a non-conducting surface 80 centimeters above the ground plane floor and 40 centimeters from the ground plane wall. The EUT and associated system are configured to operate continuously, representing a "normally operating" mode. The emissions are recorded using the required bandwidth of 9kHz in the quasi-peak mode. The average amplitude is also observed employing a 10KHz bandwidth to determine the presence of broadband RFI. When such interference is caused by broadband sources (as defined by the FCC and ANSI Rules), the deviation guidelines contained in Section 11.3.1 of ANSI C63.4 are employed, which allows a correction factor of 13dB to be subtracted from the quasi-peak reading. The emissions levels are then compared to the applicable FCC limits to determine compliance.

Electromagnetic Engineering Services, Incorporated
FCC, Part 15.247 Unintentional Radiated Emissions Data Sheet
(10m Open Area Test)

Client: **Solctek**
EUT: **Wireless LAN Transceiver**
Model #: **MP1100 (Receive Mode, Worst Case Antennas)**

Conducted by: 
Date of Test: **04-02-98**
Test Distance, Amp. gain: **3m, 0dB**

Frequency (MHz)	Spectrum Analyzer Reading at 3m (dBμV)	Antenna Polarization (vertical or horizontal)	Amp. Gain & Cable Loss, Distance & Antenna Factor Correction for 3m (dBμV/m)	Total Interference Level at 3m (dBμV/m)	Emission Spec. Limit at 3m (dBμV/m)	Difference Margin at 3m
166.740	8.9	h	20.0	28.9	43.5	-14.6
266.800	9.5	h	18.6	28.1	64.4	-18.3
363.070	11.2	v	21.4	32.6	46.4	-13.9
1008.320	2.8	v	27.9	30.7	49.5	-18.8
1120.085	3.6	v	28.2	31.8	49.5	-17.7
1152.405	3.6	v	28.3	31.9	49.5	-17.6
1232.280	4.6	v	29.0	33.6	49.5	-15.9
1344.500	3.9	v	29.3	33.2	49.5	-16.3
2134.870	4.3	h	33.2	37.5	49.5	-12.0
4280.030	7.8	h	39.9	47.7	49.5	-1.8
4356.045	8.4	h	39.8	48.2	49.5	-1.3
6419.995	-0.9	h	43.3	42.4	49.5	-7.1
8559.985	-0.7	h	47.2	46.5	49.5	-3.0

NOTE: These tabulated figures were correction figured in for 3m.

Test Conditions: Standard radiated emissions test set up on FCC registered open field site. The highest emissions for all antenna heights, polarities, and table orientations are the only emissions recorded.

15.203 Unique Antenna Connector Description

All Solectek antennas have the unique proprietary identification circuit fitted that causes it to be exclusive to Solectek equipment.

This guarantees that if a non-Solectek antenna were substituted, then the equipment's antenna sensing device would ensure that the output power is virtually zero.

CONCLUSION: This sensing refinement, as was witnessed, plotted and attested to, proves that these antennas function like all other certified Solectek antennas. Therefore, fulfilling its obligation to FCC rule 15.203.

Note: Refer to Section 15.247(b), Peak Output Power for measured Power Output.

15.247(d)

Transmitted Power Density

The transmitted power density over any 1 second interval shall not be greater than 8dBm in any 3KHz bandwidth within these bandwidths.

Spectral Density (Test Setup)

Note: The 30° Omni was used because it causes the Out-Door Unit to generate the greatest power.

PAGE #	DESCRIPTION	FCC ID #
38	Certification of Transceiver Model MP1100	KA324WAN4

NAME OF TEST: AC POWER-LINE CONDUCTED INTERFERENCE

PARAGRAPH: 15.207

TEST CONDITIONS: STANDARD TEMPERATURE AND HUMIDITY

SPEC. LIMIT: $\leq 250 \mu\text{V}$

TEST EQUIPMENT: AS PER ATTACHED PAGE

REFERENCE STANDARDS

1. American National Standard Specifications for Electromagnetic Interference and Field Strength Instrumentations 10kHz to 10GHz, ANSI C 63.2 (1980)
2. American National Standard Methods of Measurement of Electromagnetic Emissions from Low Voltage and Electronic Equipment in the range of 10kHz to 1GHz, ANSI C63.4 (1992)
3. Part 15 of FCC Rules and Regulations (47 CFR Part 15)

MEASUREMENT PROCEDURE

1. Table mounted or hand-held E.U.T.'s were placed on a non-conducting 1.0 x 1.5m table at a height of 0.8m above an earth-grounded conducting surface of 2.5 x 3.0m.
2. Floor mounted E.U.T.'s were placed directly on insulating material covering the ground plane and arranged as specified in ANSI C63.4 (1992).
3. The test sample was connected to the Public Utility lines through a LISN Ailtech Model 94641-1(50 μh).
4. A reference level of 250 μV was set on the Spectrum Analyzer. The spectrum searched was over the range of 450kHz to 30MHz.
5. All other emissions were 20dB or more below limit.
6. MEASUREMENT RESULTS: ATTACHED
