1.0 SCOPE

This report outlines the measurements made and results collected during electromagnetic emissions testing of the Sierra Wireless AirCard 580 Dual-Band CDMA PCMCIA Modem. The Dual-Band CDMA Modem has an onboard antenna and an RF output port. When utilized, the RF output port disconnects the transmitter from the onboard antenna. For the purpose of this report, only the RF output port was investigated based on the Itronix IX260+ Rugged Laptop PC does not utilize the onboard antenna, but uses an external dipole antenna on the LCD display connected to the modem RF output port via RF cable. The measurement results were applied against the applicable EMC requirements and limits outlined in the technical rules and regulations set forth in the Federal Communication Commission Code of Federal Regulations Title 47 Part 2, 22 Subpart H, and 24 Subpart E; and Industry Canada Radio Standards Specifications RSS-132 Issue 1 (Provisional) and RSS-133 Issue 2 Revision 1.

4.0 FACILITIES AND ACCREDITATIONS

The facilities used in collecting the test results outlined in this report are located at 1955 Moss Court, Kelowna, British Columbia, Canada, V1Y 9L3. The radiated and conducted emissions sites conform with the requirements set forth in ANSI C63.4 and are filed and listed with the FCC under Registration Number 714830 and Industry Canada under File Number IC 3874.

5.6 Mode(s) of Operation Tested

5.6.1 Dual-Band CDMA Modem

Customer supplied software was used to set the CDMA Modem to the appropriate channel and power level for the specific measurement. Measurements were made with the CDMA modem set to each of low, mid, and high channel in each band, or on a mid channel, as applicable for the rule part being evaluated. The following settings were used for each channel.

5.6.1.1 Cellular CDMA

TX Frequency Range:	824.7 - 848.31 MHz Ch. 1013 (824.700 MHz) (low), Ch. 384 (836.52 MHz) (mid) & Ch. 777 (848.310 MHz) (high) measured unless otherwise noted
Software Power Gain Settings:	Set by manufacturer software or CDMA test set communications for "all ups"
Modulation Type(s):	QPSK

5.6.1.2 PCS CDMA

TX Frequency Range:	1851.25 - 1908.75 MHz Ch. 25 (1851.25 MHz) (low), Ch 600 (1880 MHz) (mid) & Ch. 1175 (1908.75 MHz) (high) measured unless otherwise noted
Software Power Gain Settings:	Set by manufacturer software or CDMA test set communications for "all ups"

5.6.2 DUT Exercising Software Description

The DUT was configured and exercised during conducted testing using customer supplied Directed Test Version 2.8 test software, that allowed an operator to place the Dual-Band CDMA modem in an “all ups” mode. The modem manufacturer described this mode as one in which the modem transmitted at its maximum power level.

5.7 Configuration Description

The DUT was configured, as described by the client as being representative of what would be delivered to a final customer. More specific details may be included in each appendix.

5.7.1 Configuration Justification

The DUT was tested in a configuration described by the client as being worst-case but typical of normal use.

6.0 PASS/FAIL CRITERIA

Unless otherwise noted in the Appendices, the pass/fail criteria is the limit set forth in the reference standards. A DUT is considered to have passed the requirements, if the data collected during the described measurement procedure is within the specified limits as defined. The pass/fail statements made in this report only apply to the unit tested.

Measurement Equipment Settings	Power Meter Settings: Mode - MAP Frequency compensation set for carrier frequency Offset set appropriately to compensate for any attenuator or cable losses
Measurement Procedure	The RF conducted power levels for both PCS and cellular bands were measured at the DUT antenna connector port using a Gigatronics 8652A Universal Power Meter in mean average power mode. An offset was entered into the power meter to correct for the losses of the attenuator and cable installed between the output port and the power sensor input. The DUT test software was used to set it to transmit in the CDMA "always up" power control mode.

B.9. PASS/FAIL

There is no modular pass/fail criterion for this measurement. Applicable limits in ERP/EIRP are in place once the modem is connected to an antenna. The application of these limits is covered in the reports issued for the specific installation.

B.10. SIGN-OFF

I attest to the accuracy of the data. All measurements reported herein were performed by me and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements.

C.5. MEASUREMENT EQUIPMENT SETUP

Measurement Equipment Connections	The equipment was connected as shown in the setup drawing in C.6.
Measurement Equipment Settings	Spectrum Analyzer Settings: Detector: Peak Resolution Bandwidth: 30 kHz or 10 kHz* Video Bandwidth: 30 kHz Offset: Set to compensate for losses in through the 30 dB attenuator and attachment RF cable. * Pursuant to §22.917 (b), the RBW used may be less than 1% of the EBW and the resulting emission level corrected with a factor equal to $10 * \log (1\%EBW/RBW)$
Measurement Procedure	The conducted RF emission level was measured using a spectrum analyzer connected to the RF output port through a 30 dB attenuator and RF cable. A power meter was used to determine the loss through the cable and attenuator prior to their use with the spectrum analyzer. This loss was offset with factors applied internally in the analyzer. The DUT test software was used to set the modem to transmit in the CDMA "always up" power control mode, on the channels closest to the edge of the licensed band.

777	848.310	1.393	1.2490	-15.12 (corrected)	-13	Pass

C.9. PASS/FAIL

In reference to the results outlined in C.8, the DUT passes the requirements as stated in the reference standards.

FCC CFR 4 §22.917(a) Out of Band Emissions. The mean power of emissions must be attenuated below the mean power of the unmodulated carrier (P) on any frequency twice or more than twice the fundamental frequency by: at least $43 + 10 \log P$ dB.

The results set forth in this section meet the requirement with a maximum out-of-band emission, within 1 MHz of the edge, with a level of -14.72 dB at the lower block-edge and -15.12 dB at the upper block-edge.

D.5. MEASUREMENT EQUIPMENT SETUP

Measurement Equipment Connections	The equipment was connected as shown in the setup drawing in D.6.
Measurement Equipment Settings	Spectrum Analyzer Settings: Detector: Peak Resolution Bandwidth: 1 MHz* Video Bandwidth: 1 MHz Offset: Set to compensate for losses in through the 30 dB attenuator and attachment RF cable. * Pursuant to §22.917 (b), a RBW of 100 kHz or greater is to be employed.
Measurement Procedure	The conducted RF spurious emission level was measured using a spectrum analyzer connected to the RF output port through a 30 dB attenuator and RF cable. A power meter was used to determine the loss through the cable and attenuator prior to their use with the spectrum analyzer. This loss was offset with factors applied internally in the analyzer. To improve accuracy of measurement over the frequency range of 10 MHz to 10 GHz (10th harmonic of the carrier), sub-sub ranges were measured and the resulting spectrum analyzer displays recorded. The DUT test software was used to set the modem to transmit in the CDMA “always up” power control mode on each of the low, mid and high channels.

Measurement Procedure	The conducted RF spurious emission level was measured using a spectrum analyzer connected to the RF output port through a 30 dB attenuator and RF cable. A power meter was used to determine the loss through the cable and attenuator prior to their use with the spectrum analyzer. This loss was offset with factors applied internally in the analyzer. To improve accuracy of measurement over the frequency range of 10 MHz to 20 GHz (10th harmonic of the carrier), sub-sub ranges were measured and the resulting spectrum analyzer displays recorded. The DUT test software was used to set the modem to transmit in the CDMA "always up" power control mode on each of the low, mid and high channels.

G.9. PASS/FAIL

In reference to the results outlined in G.8, the DUT passes the requirements as stated in the reference standards.

FCC CFR 4 §24.232(a) Out of Band Emissions. The mean power of emissions must be attenuated below the mean power of the unmodulated carrier (P) on any frequency twice or more than twice the fundamental frequency by: at least $43 + 10 \log P$ dB.

The results set forth in this section meet the requirement for out-of-band emission, greater than 1 MHz from the edge of the licensed band, with a maximum level of -31.84 dB measured at 2.145 GHz with the modem transmitting on Channel 600.

G.10. SIGN-OFF

I attest to the accuracy of the data. All measurements reported herein were performed by me and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements.

H.10. PASS/FAIL

In reference to the results outlined in H.9, the PCTEST measurement report states that the DUT passes the requirements as stated in the reference standards.

FCC CFR 4 §24.235 The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

*Based on the frequency separation between a block edge and the closest channel fundamental frequency, the limit would be 1.25 MHz.

The results set forth in the PCTEST measurement report indicate the DUT meets the requirement with maximum frequency deviations of +250 Hz and -190 Hz.
