

7.6.2 Radiated Spurious Emissions(Restricted Bands) - FCC Section 15.205

Radiated emissions tests were made over the frequency range of 30MHz to 25GHz, 10 times the highest fundamental frequency. Measurements of the radiated field strength were made at a distance of 3m from the boundary of the equipment under test(EUT)and the receiving antenna. The antenna height was varied from 1m to 4m so that the maximum radiated emissions level would be detected. The spectrum analyzer's video and resolution bandwidths were set to 1MHz.

Due to high ambient noise levels and small EUT size, radiated emission measurements may be made at a distance of 1 meter. An inverse proportionality factor of 20 dB per decade is used to normalize the measured data to the specified distance to determine compliance. The formula used to calculate an inverse proportionality factor is $20 \log (D1/D2)$, where D1 is the distance used and D2 is the specified distance.

Of the antennas listed in section 1.2.4, only the three identified below were tested. These antennas are the highest gain of their respective types and are considered worst case of all the antennas in section 1.2.4. The antennas tested are:

Manufacturer	Model Number	LXE Part Number	Type	Gain(dBi)
Cushcraft	PC2415	460602-3020	Yagi	15
Cushcraft	245BD5W	480424-0411	Patch	4&6
Mobile Mark	OD9-2500	480424-3411	Omnidirectional	9

The EUT was caused to generate a constant carrier on the high, mid and low channels of operation at each of the data rates available. Tables 7, 8 and 9 below, show the results of all recordable points in the band of evaluation. Plots of each significant signal were also taken for each antenna and can be found following the respective tables:

Table 7: 460602-3020 15dBi Yagi

Channel	Data Rate (Mbps)	Frequency (MHz)	Antenna Distance (m)	Receiver Level (dBm)	Correction Factors (dB)	Corrected Level (dBm)	Corrected Level (uV/m)	Limit (uV/m)	Margin (uV)

*Noise Floor Measurement

Correction Factors

AF = Antenna Factor

CA = Cable Attenuation

AG = Amplifier Gain

RL = Receiver Level

RC = Range Correction = $20\log(D1/D2)$ Where D1 is the specified distance used and D2 is the distance used to make measurements = $[20\log(3/1)] = 9.54$ dB

Therefore:

CF_T = Total Correction Factor = RL+AF+CA-AG-RC**Sample Calculations**Corrected Level(dBm) = RL+ CF_TConversion from dBm to uV/m = $\text{Antilog}(\text{dBm} + 107)/20$

Anders och hans hustru gifte sig i Stockholm den 17 Mars 1772. Anders var då 24 år gammal och hustrun 21 år gammal. De gifte sig i St. Nikolai kyrka i Stockholm. Anders var då borgare i Stockholm och hustrun var dotter till en borgare i Stockholm. De gifte sig i St. Nikolai kyrka i Stockholm. Anders var då borgare i Stockholm och hustrun var dotter till en borgare i Stockholm.

1. The first part of the document is a list of names and addresses, which appears to be a directory or a list of contacts. The names are written in a cursive script, and the addresses are listed below them.

8.7 Power Spectral Density - FCC Section 15.247(d)

The spectral density was measured in accordance with OET bulletin 97-114, appendix C. The EUT was caused to generate a constant carrier on a high, middle and low channels at all the available data rates. The results are recorded in Table 7 below. Plots were also taken of each of the emissions and can be found in order, in appendix C of this report.

Table 10: Spectral Density

Channel	Data Rate (Mbps)	Receiver Level (dBm)	Limit (dBm)	Margin (dB)
1 (2412 MHz)	2	-9.50	8	17.50
	5.5	-10.17	8	18.17
