1.0 GENERAL

1.1 Introduction

The purpose of this class 2 permissive change filing is to report findings of compliance testing performed to add the antennas listed in section 1.2 for use with the LXE 4810P3S01US Radio. The following report demonstrates compliance with Part 15, Subpart C of the FCC's Code of Federal Regulations.

1.2 Product Description

The EUT is the combination of the LXE Model 4810P3S01US Transceiver and the antennas listed in below.

The 4810P3S01US is a UHF, Frequency Hopping, Spread Spectrum, 250mW Transceiver intended for data link applications in the 902-928 MHz band.

1.3 Antennas

The 4810P3S01US transceiver was originally approved with generic 0dBi ¼ wave whip antenna. Table 1 below identifies and briefly describes the new antennas added by this filing. Specification pages and photographs of these antennas are included separately in this filing if available.

Table 1: New Antennas

LXE Antenna List							
LXE P/N	Mfg.	Mfg. P/N	Antenna Type	Gain (dBi)	System EIRP (dBm)	Intended Use (Mobile/Portable)	Required MPE Distance(cm)
148693-0001	Hytennas	10519	Omni	2.5	26.5	Mobile	4.62
148694-0001	Hytennas	10556	Omni	2.5	26.5	Mobile	4.62
148695-0001	Hytennas	10542	Omni	2.5	26.5	Mobile	4.62
155102-0001*	LXE	155102-0001	Omni	0	24	Portable	N/A
156428-0001*	LXE	156428-0001	Patch	0	24	Portable	N/A

* Will be used in device defined as portable and is exempt from MPE. See section 8.3 for RF safety compliance information of these antennas.

2.0 LOCATION OF TEST FACILITY

The LXE test facility is located at the following address:

LXE, Inc.
 An Electromagnetic Sciences Company
 125 Technology Parkway
 Norcross, GA US 30092-2993
 Tel: (770) 447-4224
 Fax: (770) 447-6928

Radiated emission tests were conducted at the manufacturer's test facility at a location specifically prepared for this testing. The radiated emissions test site meets the characteristics of ANSI C63.4:1992, CISPR 16 and EN 55022:1994. This site has been fully described and submitted to the FCC, and accepted in their letter marked 31040/SIT, 1300F2.

3.0 DESCRIPTION OF OPEN AREA TEST SITE

The open area test site(OATS) is located in the center of the rooftop of the building. The roof is located at a height of approximately 8 meters above the ground. The 3 meters radiated emissions test site is an open, flat area (open area) test site approximately 6.2m x 9.2m in dimension. All reflecting objects including test personnel lie outside the perimeter of the ellipse. The 3 meters test site ground plane is made of a 1/4" metal screen mesh which extends 2 meters past the mast and equipment under test(EUT). Material of the ground plane, comprised of individual 1/4" metal screen mesh rolls, were soldered at the seams with gaps smaller than 1/10 of the wavelength at 1000MHz. The ground plane is connected to the earth ground by ground rods. All wiring is done at floor level around the test site periphery. The radiated emissions test setup is shown in figure 1.

3.1 Radiated Emissions Testing Facility Drawing

All dimensions are in meters(m)

Figure 1: Open Area Test Site(OATS)

4.0 APPLICABLE STANDARD REFERENCES

The following standards were used to determine compliance:

- 1 - ANSI C63.4-1992: Method of Measurements of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the 9KHz to 40GHz
- 2 - US Code of Federal Regulations (CRF): Title 47, Part 15, Radio Frequency Devices, Subpart C, Intentional Radiators (October 1997)
- 3 - FCC Report and Order 97-114: Amendment of Parts 2 and 15 of the Commission's rules regarding Spread Spectrum Transmitters.
- 4 - OET Bulletin 65, Supplement C, Section 3: RF Exposure Compliance for Spread Spectrum Transmitters.

5.0 LIST OF TEST EQUIPMENT

Radiated field strength measurements are taken with a spectrum analyzer. For peak measurements the spectrum analyzer was set with both the VBW and the RBW at 1MHz. Average measurements were taken with the RBW at 1MHz and the VBW at 10Hz. The sweep rate was set to auto to optimize the measurement. Adequate attenuation was used to protect the analyzer from damage.

6.0 TEST METHODOLOGY

For the radiated emissions tests, measurements were made over the frequency range of 30MHz to 10 times the highest fundamental frequency. Measurements of the radiated field strength were made at a distance of 3m from the boundary of the equipment under test(EUT) and the receiving antenna. The antenna height was varied from 1m to 4m so that the maximum radiated emissions level would be detected. A non-conductive remotely controlled turntable approximately 0.91m x 1.2m x 0.8m was used to measure radiated emissions from all sides of the EUT. The turntable has a center opening that allows cabling to be routed directly down to the conducting ground plane.

Due to high ambient noise levels and small EUT size, radiated emission measurements may be made at a distance of 1 meter. An inverse proportionality factor of 20 dB per decade is used to normalize the measured data to the specified distance to determine compliance. The formula used to calculate an inverse proportionality factor is $20 \log (D1/D2)$, where D1 is the distance used and D2 is the specified distance.

Radiated measurements were made with the Spectrum Analyzer's resolution bandwidth set to 120KHz for measurements above 30MHz and below 1000MHz, and 1MHz for measurements above 1000 MHz.

7.1 EQUIPMENT UNDER TEST SETUP BLOCK DIAGRAM**Figure 2: Test Setup Block Diagram**

8.0 SUMMARY OF TESTS

Along with the tabular data shown below, plots were also taken of all signals deemed important enough to document. Plots are included in the appendix.

8.1 Section 15.203 - Antenna Requirement

All antennas listed in section 1.3 are equipped with R-TNC or MMCX connecting arrangements

8.2 Section 15.247(b)(4) - RF Safety

Refer to section 1.3 for the intended use of each antenna included in this filing. All mobile equipment installation guides contain the following statement:

“This device is intended to transmit RF energy. For protection against excessive RF exposure to humans and in accordance with FCC rules, this equipment should be installed such that a minimum separation distance of at least 20cm is maintained between the radiating element and the user”

SAR Testing was performed on the combination of the 4810P3S01US transceiver and LXE antenna 155102-0001 in an out of box configuration with satisfactory results. This configuration was deemed worst case as this antenna, when installed in the host device, will be in the closest proximity of the user. LXE antenna 155426-0001 is assumed to be compliant based on these results. The SAR report is submitted separately with this filing.

8.3 Radiated Spurious Emissions(Restricted Bands)

The peak radiated spurious emissions found in the restricted bands are reported below in table 4 and plots of each can be found in the appendix. Only the highest gain of each type antenna was tested and the remaining are assumed compliant based on the satisfactory results.

Table 4: Radiated Spurious Emissions

Frequency (MHz)	Antenna Distance (m)	Level (dBm)	Detector Function (P/A)	Duty Cycle Correction (dB)	Correction Factors (dB)	Corrected Level (dBm)	Corrected Level (uV/m)	Limit (uV/m)	Margin (dB)	Final Result (Pass/Fail)

9.0 CONCLUSION

The product covered by this report has been tested and found to comply with the requirements as described in Part 15, Subpart C, Section 15.247 of the FCC Code of Federal Regulations.
