Brakebuddy® A.L.E.R.T. System

The A.L.E.R.T. system allows you to monitor the braking in your towed vehicle conveniently at any time. This system consists of two key parts, which must be installed correctly for the A.L.E.R.T. System to work properly. These parts are the Transmitter and the Receiver.

The Receiver (Larger) simply Velcro's in a convenient place and plugs into the 12v accessory adapter in your motorcoach for power.

The Remote Transmitter (Smaller) simply plugs into the white and the black banana jack on the top of the BrakeBuddy for power.

After installing the BrakeBuddy and Alert System, a simple test should be performed every time. Have someone push the red test button on the BrakeBuddy and hold it for at least ten seconds while you are in your motor-home looking at the indicator light on the Alert. The indicator light should illuminate for the full ten seconds without blinking. Do not do this while motor home is moving! The Alert System will activate with the breakaway, test button or when braking.

If the alert does not function with this test call our tech support at 1-800-470-2287.
