Description of E.U.T.

The equipment is a VHF receiver module.

Modifications Incorporated in E.U.T.

The EUT has not been modified from what is described by the brand name and unique type identification stated above.

EQUIPMENT: VHF Rx Unit
FCC ID: KVV60431942

Theory of Operation

The EU231 VHF Rx Unit is a superhetrodyne receiver designed for operation in the band 118 – 144 MHz. This equipment is designed to receive conventional amplitude modulation, (full carrier, doubled side band) signals.

EQUIPMENT: VHF Rx Unit
FCC ID: KVV60431942

Justification

The E.U.T. was configured for testing as per typical installation. Position and bundling of cables were investigated to establish maximum amplitude of emissions.

The following combinations were investigated to establish worst case configuration: N/A

Exercise Program

The E.U.T. exercise program used during radiated and conducted testing was designed to exercise the various system components in a manner similar to typical use.

Exercise mode:

(1) The E.U.T. was in receiver mode.

NAME OF TEST: Radiated Emissions	PARA. NO.: 15.109(a)
TESTED BY: Russell Grant	DATE: November 20, 1998

Test Conditions: Test Voltage: 120
 Temperature: 20
 Humidity: 30

Minimum Standard:

Frequency(MHz)	Field Strength (dB μ V/m @ 3m)
30 - 88	40.0
88 - 216	43.5
216 - 960	46.0
Above 960	54.0

Test Results: Complies. No emissions were detected above the noise floor. Our threshold of sensitivity is -11 dB μ V/m at 30 MHz and increases uniformly to 40 dB μ V/m at 2 GHz.

Measurement Data: See attached table.

For super-regenerative receivers the receiver is cohered using a signal generator and dipole antenna.

Handheld equipment and equipment not designed to be mounted in any fixed orientation, the E.U.T. is tested in three orthogonal axis to obtain worst case results.

Section 7. Sample Calculations

Conducted Emissions:

If the Quasi-Peak to Average ratio is greater than 6 dB, then the emission is classified as broadband and its Quasi-Peak level is reduced by 13 dB for comparison to the limit.

- i.e. Quasi-Peak level = 40 dB μ V
 Average level = 34 dB μ V
 Corrected level = 40 - 13 = 27 dB μ V

Radiated Emissions

Emissions are measured at a distance of 3 meters and corrected for antenna factor and cable loss.

- i.e. Received Signal = 25 dB μ V @ 100 MHz
 Antenna Factor & Cable Loss = 9.8 dB
 Field Intensity = 25 + 9.8 = 34.8 dB μ V/m @ 3 m
