General remarks:

The test results presented in this report relate only to the object tested.

The results contained in this report reflect the results for this particular model and serial number. It is the responsibility of the manufacturer to ensure that all production models meet the intent of the requirements detailed within this report.

This report shall not be reproduced, except in full, without the written approval of the Issuing testing laboratory.

Additional comments:

The EUT uses two antenna ports with antenna diversity operation. For conducted compliance testing the antenna port (including dedicated antenna) with the highest output power was selected. For radiated testing both antenna ports were tested. Therefore antenna port 1 with antenna W200 was used for conducted compliance testing.

1.7 Sample emission level calculation

The following is a description of terms and a sample calculation, as appears in the radiated emissions data table. The numbers used in the calculation are for example only. There is no direct correlation to the specific data taken for the product described in this document:

Reading:

This is the reading obtained on the spectrum analyzer in dB μ V. Any external preamplifiers used are taken into account through internal analyzer settings.

A.F.:

This is the antenna factor for the receiving antenna. It is a conversion factor, which converts electric fields strengths to voltages, which can be measured directly on the spectrum analyzer. It is treated as a loss in dB. Cable losses have been included with the A.F. to simplify the calculations. The antenna factor is used in calculations as follows:

$$\text{Reading on Analyzer (dB}\mu\text{V)} + \text{A.F. (dB)} = \text{Net field strength (dB}\mu\text{V/m)}$$

Net:

This is the net field strength measurement (as shown above).

Limit:

This is the FCC Class B radiated emission limit (in units of dB μ V/m). The FCC limits are given in units of μ V/m. The following formula is used to convert the units of μ V/m to dB μ V/m:

$$\text{Limit (dB}\mu\text{V/m)} = 20 * \log (\mu\text{V/m})$$

Margin:

This is the margin of compliance below the FCC limit. The units are given in dB. A negative margin indicates the emission was below the limit. A positive margin indicates that the emission exceeds the limit.

Example only:

$$\begin{array}{rclclcl} \text{Reading} & + & \text{AF} & = & \text{Net Reading} & : & \text{Net reading - FCC limit} & = & \text{Margin} \\ 21.5 \text{ dB}\mu\text{V} & + & 26 \text{ dB} & = & 47.5 \text{ dB}\mu\text{V/m} & : & 47.5 \text{ dB}\mu\text{V/m} - 57.0 \text{ dB}\mu\text{V/m} & = & -9.5 \text{ dB} \end{array}$$

Requirements		
The requirements of subpart D apply only to the radio transmitter contained in the PCS device. Other aspects of the operation of a PCS device may be subject to requirements contained elsewhere in this chapter. In particular, a PCS device that includes digital circuitry not directly associated with the radio transmitter also is subject to the requirements for unintentional radiators in subpart B.		
Result		
The EUT does not contain any digital circuitry not directly associated with the radio transmitter

3.3 Test Conditions and Results – Antenna requirement

Antenna requirement acc. to FCC 47 CFR 15D			Verdict: PASS
EUT requirement rule parts and clause	Reference		
	FCC 15.317 / FCC 15.203		
Test according to measurement reference	Reference Method		
	visual inspection & declaration		
Requirements			
An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited. When an antenna conducted measurement is used to determine the RF output power of the device, the effective gain of the antenna intended for the device must be stated, based on measurement or on data from the antenna manufacturer. Any antenna gain in excess of 3 dBi (3 dB above isotropic gain) shall be added to the measured RF output power before using the power limits

3.4 Test Conditions and Results – Digital modulation

Antenna requirement acc. to FCC 47 CFR 15D / IC RSS-213		Verdict: PASS
EUT requirement rule parts and clause	Reference	
	FCC 15.319(b) / IC RSS-213 5.1	
Test according to measurement reference	Reference Method	
	Declaration	
Requirements		
All transmissions must use only digital modulation techniques.		
Results		
The test sample is an isochronous digital modulated device that operates in 1920-1930 MHz band. This device bases on DECT technology described in European Standards EN 300 175-2 and EN 300 175-3, now operating in frequency channels mentioned above. The operating modes are MC/TDMA/TDD (Multi carrier / Time Division Multiple Access / Time Division Duplex) using Digital GFSK modulation. For further details see operational description provided by manufacturer.

3.7 Test Conditions and Results – Peak transmit power

Peak transmit power acc. to FCC 47 CFR 15D / IC RSS-213					Verdict: PASS	
EUT requirement rule parts and clause		Reference				
		FCC 15.319(c),(e) / IC RSS-213 5.6				
Test according to measurement reference		Reference Method				
		ANSI C63.17 6.1.2				
Tested frequencies		F _{LOW} / F _{HIGH}				
EUT test mode		TDMA				
Antenna excess gain		0.5 dB				
Limits						
Peak transmit power shall not exceed 100 microwatts multiplied by the square root of the emission bandwidth in hertz. The peak transmit power shall be reduced by the amount in decibels that the maximum directional gain of the antenna exceeds 3 dBi.						
$P_{EUT}[dBm] \leq P_{limit} \text{ where } P_{limit} = \begin{cases} P_{max} - (G_A - g), & \text{when } G_A > 3 \text{ dBi} \\ P_{max}, & G_A < 3 \text{ dBi} \end{cases}$						
$P_{max}[dBm] = 5 \log(\text{Emission/Occupied Bandwidth [Hz]}) - 10 \text{ dBm}$						
Test setup						
						
Test procedure						
1. EUT set to test mode 2. The RBW is set to be larger than the emission bandwidth and VBW ≥ RBW 3. Transmission burst is measured in zero span and peak detector 4. The maximum level in the burst is recorded as peak transmit power

Radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)). When average radiated emission measurements are specified, including average emission measurements below 1000 MHz, there also is a limit on the peak level of the radio frequency emissions. The limit on peak radio frequency emissions is 20 dB above the maximum permitted average emission limit applicable to the equipment under test. * Measurement is performed with conducted measurement setup

3.13 Test Conditions and Results – Automatic discontinuation of Transmission

Automatic discontinuation of transmission acc. to FCC 15D / RSS-213		Verdict: PASS
EUT requirement rule parts and clause	Reference	
	FCC 15.319(f) / IC RSS-213 5.2	
Test according to measurement reference	Reference Method	
	Manual evaluation	
EUT equipment type	Portable part	
Requirements		
The device shall automatically discontinue transmission in case of either absence of information to transmit or operational failure. This is not intended to preclude transmission of control and signaling information or use of repetitive codes used by certain digital technologies to complete frame or burst intervals.		
Test setup		
EUT Splitter Companion device Spectrum analyzer		
Test procedure		
The following situations were simulated to test the reaction of the EUT: - EUT power removed - EUT switched –off - Companion device switched off - Hook-on by companion device - Hook-on by EUT - Power removed from companion device The reaction of the EUT is recorded by the following results: A – Connection breakdown, cease of all transmissions B – Connection breakdown, EUT transmits control and signalling information C – Connection breakdown, Companion device transmits control and signalling information N/A – Not applicable (the EUT or companion device does not have an on/off switch or cannot perform hook on

3.14 Test Conditions and Results – LIC Procedure Test

LIC Procedure Test acc. to FCC 47 CFR 15D / IC RSS-213			Verdict: PASS
EUT requirement rule parts and clause	Reference		
	FCC 15.323(c)(5) / IC RSS-213 5.2		
Test according referenced standards	Reference Method		
	ANSI C63.17 7.3.2		
Requirements			
FCC: If access to spectrum is not available as determined by the above, and a minimum of 20 duplex system access channels are defined for the system, the time and spectrum windows with the lowest power level may be accessed.			
IC: If access to spectrum is not available as determined by the above, and a minimum of 40 duplex system access channels are defined for the system, the time and spectrum windows with a power level below a monitoring threshold of 50 dB above the thermal noise power determined for the occupied bandwidth may be accessed.			
Test setup			
			
Test procedure			
1. The EUT is forced to two carrier frequencies f_1 and f_2 only by the use of interferer generators with power levels higher than the threshold T_L plus the measurement uncertainty U_M of 6 dB 2. Additional interferer signals are applied to the channels f_1 and f_2 according to the result table below 3. A communication session with the companion device is initiated 4. Transmission on the least interfered channel is verified 5. The communication session is terminated 6. The communications session is established another 4 times			
Test results			
Interferer Level f_1	Interferer Level f_2	Communication channel	Verdict
$T_L + U_M + 7\text{ dB}$	$T_L + U_M$	f_2	PASS
$T_L + U_M$	$T_L + U_M + 7\text{ dB}$	f_1	PASS

3.15 Test Conditions and Results – LIC Selected Channel Confirmation

LIC Selected Channel Confirmation acc. to FCC 47 CFR 15D / IC RSS-213			Verdict: PASS
EUT requirement rule parts and clause	Reference		
	FCC 15.323(c)(1) / IC RSS-213 5.2		
Test according referenced standards	Reference Method		
	ANSI C63.17 7.3.3		
Requirements			
Immediately prior to initiating transmission, devices must monitor the combined time and spectrum windows in which they intend to transmit for a period of at least 10 milliseconds for systems designed to use a 10 milliseconds or shorter frame period or at least 20 milliseconds for systems designed to use a 20 milliseconds frame period.			
Test setup			
			
Test procedure			
1. The EUT is forced to two carrier frequencies f_1 and f_2 only by the use of interferer generators with power levels 20 dB higher than the threshold T_L plus the measurement uncertainty U_M of 6 dB 2. The interferer level on channel frequency f_1 is also set to $T_L + U_M + 20\text{dB}$ and channel f_2 has no interferer 3. A communication session is initiated on f_2 and transmission on f_2 is verified 4. An interferer level of $T_L + U_M + 20\text{ dB}$ is applied to f_2 and the interferer on channel f_1 is removed 20ms after the interferer on f_2 is applied 5. Transmission on f_1 and f_2 is monitored with the spectrum analyzer and it is verified that the EUT does not transmit on f_2.			
Test results			
Initial transmit channel	Interferer level	Final transmit channel	Verdict
f_2	0	f_2	PASS
f_2	$T_L + U_M + 20\text{ dB}$	f_1	PASS

3.18 Test Conditions and Results – Monitoring reaction time and monitoring interval

Monitoring reaction time and monitoring interval acc. to FCC 47 CFR 15D / IC RSS-213		Verdict: PASS
EUT requirement rule parts and clause	Reference	
	FCC 15.323(c)(7) / IC RSS-213 5.2	
Test according referenced standards	Reference Method	
	ANSI C63.17 7.5	
Requirements		
The monitor shall have a maximum reaction time less than $50 \times \text{SQRT}(1.25/\text{emission(occupied bandwidth in MHz)})$ microseconds for signals at the applicable threshold level but shall not be required to be less than 50 microseconds. If a signal is detected that is 6 dB or more above the applicable threshold level, the maximum reaction time shall be $35 \times \text{SQRT}(1.25/\text{emission(occupied bandwidth in MHz)})$ microseconds but shall not be required to be less than 35 microseconds.		
Test setup		
 <pre> graph LR EUT[EUT] --- Splitter[Splitter] Splitter --- SA[Spectrum analyzer] Splitter --- IG[Interferer Generators] CD[Companion device] --- Splitter </pre>		
Test procedure		
- Using interferer signals operation is restricted to channel f_1 - A time-synchronized, pulsed interference is applied to f_1 with a power level of $T_L + U_M$ - For systems with a 10 ms frame time and N timeslots per frame, a channel interferer with N pulses in a 10 ms repetition period is applied - On f_2 a CW interferer with level equal to T_L is activated - The pulse width of the interferer pulses on f_1 is set to the largest of 50 μs and $50 \cdot \sqrt{1.25/\text{Bandwidth}[\text{MHz}]}$ μs - It is verified that the connection to the companion device is established on f_2 only - The level of the interferer pulses on f_1 is set to 6 dB above $T_L + U_M$ - The pulse width on f_1 is set to the largest of 35 μs and $35 \cdot \sqrt{1.25/\text{Bandwidth}[\text{MHz}]}$ μs - It is verified that the connection to the companion device is established on f_2 only

Test according referenced standards	Reference Method	
	ANSI C63.17 8.2.1	
EUT can initiate a communication session	Yes	
Requirements		
Once access to specific combined time and spectrum windows is obtained, an acknowledgement from a system participant must be received by the initiating transmitter within one second or transmission must cease. Periodic acknowledgements must be received at least every 30 seconds or transmission must cease.		
Test setup		
 <pre>graph LR; EUT[EUT] --- Splitter[Splitter]; Splitter --- SA[Spectrum analyzer]; Splitter --- IG[Interferer Generators]; CD[Companion device] --- Splitter</pre>		
Test procedure		
1. (Applies to EUTs that can initiate a communication session (e.g. portable parts)) The acknowledgement timeslots are blocked by interferer signals 2. An attempt to establish communication session is started from the EUT 3. The emissions from the EUT are monitored to verify that the EUT does not transmit for more than 1s 4. Next the acknowledgements are unblocked and another communication session is established between the EUT and the companion device 5. It is verified that the communication session is successful 6. (Applies to all EUTs) With all acknowledges unblocked, an communication session is initiated between the EUT and the companion device 7. The acknowledgements were blocked and the time the EUT continues to transmit is recorded

3.20 Test Conditions and Results – Transmission duration

Transmission duration acc. to FCC 47 CFR 15D / IC RSS-213		Verdict: N/A
EUT requirement rule parts and clause	Reference	
	FCC 15.323(c)(3) / IC RSS-213 5.2	
Test according referenced standards	Reference Method	
	ANSI C63.17 8.2.2	
Requirements		
If no signal above the threshold level is detected, transmission may commence and continue with the same emission bandwidth in the monitored time and spectrum windows without further monitoring. However, occupation of the same combined time and spectrum windows by a device or group of cooperating devices continuously over a period of time longer than 8 hours is not permitted without repeating the access criteria.		
Test setup		
 <pre>graph LR; EUT[EUT] --- Splitter[Splitter]; Splitter --- SA[Spectrum analyzer]; Splitter --- IG[Interferer Generators]; CD[Companion device] --- Splitter</pre>		
Test procedure		
1. A communication session is established between the EUT and the companion device. 2. With the beginning of the communication session a counter is started 3. An interferer is introduced on the communication channel to force the EUT to select a different communication channel if the communications has to be reestablished 4. As soon as the communication session switches to a different channel the time measurement is stopped		
Test results		
Total transmission time [h]	Transmission time limit	Verdict
1.0	8 hours	PASS
Comments:		
For the DECT system the communication session is established by the portable part and the fixed part simply follows the portable part. Hence it's the responsibility of the portable part to control the maximum transmit period.		

3.21 Test Conditions and Results – Duplex connections

Duplex connections acc. to FCC 47 CFR 15D / IC RSS-213		Verdict: PASS
EUT requirement rule parts and clause	Reference	
	FCC 15.323(c)(10) / IC RSS-213 5.2	
Test according referenced standards	Reference Method	
	ANSI C63.17 8.3	
EUT implements LIC algorithm	Yes	
Number of duplex channels	> 20	
Requirements		
An initiating device may attempt to establish a duplex connection by monitoring both its intended transmit and receive time and spectrum windows. If both the intended transmit and receive time and spectrum windows meet the access criteria, then the initiating device can initiate a transmission in the intended transmit time and spectrum window. If the power detected by the responding device can be decoded as a duplex connection signal from the initiating device, then the responding device may immediately begin transmitting on the receive time and spectrum window monitored by the initiating device.		
Test setup		
		

Test procedure (EUT implements LIC algorithm and offer at least 20 duplex channels)			
1. The path loss between the EUT and the companion device is adjusted such that the received signal to the EUT is at least 40 dB above $T_L + U_M$ 2. By the use of interference signals the EUT is restricted to channel f_1 3. An interference of level $T_L + U_M$ is applied per carrier on the enabled carriers on all its transmit time/spectrum windows except one, which has interference at least 10 dB below T_L 4. An interference of level $T_L + U_M + 7\text{dB}$ is applied per carrier on the enabled carriers on all its receive time/spectrum windows except one, which has interference at least 10 dB below T_L. The interference free receive time/spectrum window must not be the duplex mate of the interference-free transmit time/spectrum window 5. It is verified that the interference levels at the companion device are at least 10 dB below T_L for all time/spectrum windows 6. An attempt is made to establish a connection and it is verified that the connection is established on the interference-free receive time/spectrum window and its duplex mate 7. Next an interference of level $T_L + U_M + 7\text{dB}$ is applied per carrier on the enabled carriers on all its transmit time/spectrum windows except one, which has interference at least 10 dB below T_L 8. An interference of level $T_L + U_M$ is applied per carrier on the enabled carriers on all its receive time/spectrum windows except one, which has interference at least 10 dB below T_L. The interference free receive time/spectrum window must not be the duplex mate of the interference-free transmit time/spectrum window 9. It is verified that the interference levels at the companion device are at least 10 dB below T_L for all time/spectrum windows 10. An attempt is made to establish a connection and it is verified that the connection is established on the interference-free transmit time/spectrum window and its duplex mate			
Test results
