

Exhibit H:

L5X-PMP-04-240

Measured RF Output Power

This Exhibit provides a response to Section 2.1046 (a), based on the transmitter power limitations of Section 101.113.

Transmitter Power Limitations:

<u>Frequency</u>	<u>Max Allowable EIRP</u>
24,250 MHz to 25,250 MHz	+55 dBW

Each Remote antenna in the 24 GHz Frequency Band has a gain of 37.2 dBi as specified by the vendor. This gain applies to the upper end of the band.

The power amplifiers in the 24 GHz band Outdoor Units have a P1dB of +26 dBm at the antenna interface. With no backoff the maximum EIRP of this system will be (37.0 dBi + 26 dBm) or 63.0 dBm. In practice, this equipment will operate with a minimum backoff of 3 dB. This will provide a peak EIRP of 60.0 dBm or 30.0 dBW.

The antennas are discussed in more detail in Exhibit N.

The above calculations indicate that the equipment will not exceed the maximum EIRP limitation of +55 dBW at any time.
