4.0 EQUIPMENT UNDER TEST CONFIGURATION

The Cellular Repeater was configured with AC power supply modules and a digital signal generator was used to simulate various CDMA (i.e. QPSK Modulation type), TDMA and FM cellular RF input signals to the EUT. The EUT with host external computer was configured for maximum signal gain and bandwidth. The EUT was operated in a manner representative of the typical usage of the equipment. During all testing, system components were manipulated within the confines of typical usage to maximize each emission.

6.0 TEST RESULTS

6.1 TEST TYPE: Radiated Emissions

6.1.1 TECHNICAL SPECIFICATION: 47 CFR 2.1053; 22.109(d); 22.917(e)

6.1.2 TEST DATE(S): Sep.16, 1999

6.1.3 MEASUREMENT PROCEDURES:

As required by §2.1053, *field strength of spurious radiation measurements* were made in accordance with the general procedures of ANSI C63.4-1992 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9kHz to 40 GHz". Preliminary radiated emission measurements were performed inside a shielded chamber with all digital signal generators on and terminated. The frequency list from the preliminary measurements was used as a guide for making final measurements on a 10 meter open area test site. The unit was scanned over the frequency range of 30MHz to 9 GHz.

The Radiated Spurious Emissions *Limit* is obtained by the following:

Based on an output power (as measured at the output of the Amplifier) of 4 watts:

$$P_o = 4 \text{ W}$$

As per 2.993 (a), it is assumed this power is to be fed to a half-wave tuned dipole. Using a conversion formula for distance, the field strength at one meter can be derived:

$$E(V/m)_{1m} = \frac{\sqrt{49.2 \times 4}}{1}$$
$$E(V/m)_{1m} = 14.0 \text{ V/m or } 143 \text{ dB}\mu\text{V}$$

As per 22.917(e), the spurious emissions must be attenuated by $43 + 10\log(P)$ which is:

$$43 + 10\log(4) = 49 \text{ dB}$$

Therefore, the limit for spurious emissions is:

$$143 \text{ dB}\mu\text{V} - 49 \text{ dB} = 94 \text{ dB}\mu\text{V @ } 1m$$

At 3 meters measurement distance, the limit is;

$$E(V/m)_{3m} = \frac{\sqrt{49.2 \times 4}}{3}$$
$$E(V/m)_{3m} = 4.67 \text{ V/m or } 133.4 \text{ dB}\mu\text{V}$$

According to 22.917(e), all signals must be attenuated by 49 dB. Therefore, the limit for spurious emissions for a test distance of 3 meters is:

$$133.4 - 49 = 84.38 \text{ dB}\mu\text{V @ } 3m$$

6.1.4 RESULTS:

6.4 TEST TYPE: Spurious Emissions at Antenna Terminals— Uplink Channels

6.4.1 TECHNICAL SPECIFICATION: 47 CFR 2.1051; 22.917(e)

6.4.2 TEST DATE(S): 18 Sep 1999

6.4.3 MEASUREMENT PROCEDURES:

As required by 47 CFR 2.1051, *spurious emissions at antenna terminal measurements* were made at the RF output terminals using a 50 Ω attenuator and spectrum analyzer set for a 30 kHz bandwidth. This test was performed with Digitally modulated carrier signals. The Digital signal generator was adjusted for continuous transmit on frequencies in both the uplink and down-link frequency bands. The frequency spectrum was investigated from 9.0 KHz to 9.0 GHz. For measuring emissions above 2 GHz, a high-pass filter was used to eliminate the fundamental transmit frequency to prevent possible saturation effects on the front end of the spectrum analyzer.

6.4.4 RESULTS:

Equipment complies with Sections 2.1051 and 22.917(e)

As recommended in 47 CFR 22.917(h)(ii), a 30kHz bandwidth was chosen to measure the peak of any spurious emission at 45 kHz removed from the carrier. The unit was exercised using signal types required by 47 CFR 2.1049.

$$\text{Spur limit} = P_o - (43 + 10\log P) = 143 \text{ dB}\mu\text{V} - (49 \text{ dB}) = 94 \text{ dB}\mu\text{V} = -13.1 \text{ dBm}$$
