2 Technical test

2.1 Summary of test results

The radiated measurements were performed horizontal, vertical results are about 5 dB lower over the whole frequency range.

The antenna gain measurement was performed by the difference between conducted and radiated output measurement.

All measurement settings are according to FCC 15.35, 15.205, 15.209, 15.247 and the „Measurement guidelines for FHSS systems“.

Measurements below 1 GHz were performed with a CISPR Quasi Peak Adapter, over 1 GHz we used peak measurements. At peaks we did an second, average measurement.

ResBW and VBW were according FCC requirements.

No deviations from the technical specification(s) were ascertained in the course of the tests performed.

The samples fullfill also the requirements according CANADA RSS-210

Time of occupancy (dwell time)

§15.247(a)

The max. duration of signal is 0.827 ms. the worst case (shortest) period for repetition of signals on one channel is 800 ms. This period equates to approximately 38 pulses within 30 seconds. based on this rate and a signal duration of 0.810 ms, the longest duration would be $38 \times 0.810 \text{ ms} = 30.78 \text{ ms}$. Based on this criteria, the SIEMENS GIGASET 4010 Base station meets the average time of occupancy requirements of FCC15.247. Even in the case of connections to 4 mobile parts ($4 \times 30.78 \text{ ms} = 123.12 \text{ ms}$), the limit requirements are fulfilled.
