2 Technical test

2.1 Summary of test results

The radiated measurements were performed vertically, horizontal results are about 2 dB lower over the whole frequency range.

The antenna gain measurement was performed by the difference between conducted and radiated output measurement.

All measurement settings are according to FCC 15.35, 15.205, 15.209, 15.247 and the „Measurement guidelines for FHSS systems“.

No deviations from the technical specification(s) were ascertained in the course of the tests performed.

Time of occupancy (dwell time) for DH1

§15.247(a)

The system makes worst case 1600 hops per second or 1 time slot has a length of 625µs with 79 channels. A DH1 Packet need 1 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case 800 hops per second with 79 channels. So you have each channel 10.13 times per second and so for 30 seconds you have 303.9 times of appearance .

Each tx-time per appearance is 470 µs.

So we have $303.9 * 473 \mu s = 143.7 \text{ ms}$ per 30 seconds.

Time of occupancy (dwell time) for DH3

\$15.247(a)

A DH3 Packets need 3 time slots for transmit and 1 for receicing, then the system makes worst case 400 hops per second with 79 channels. So you have each channel 5.1 times per second and so for 30 seconds you have 153 times of appearance .

Each tx-time per appearance is 1.70 ms.

So we have $153 * 1.70 \text{ ms} = 260.1 \text{ ms}$ per 30 seconds.

\$15.247(a)

At DH5 Packets you need 5 time slots for transmit and 1 for receicing,then the system makes worst case 266,7 hops per second with 79 channels. So you have each channel 3.36 times per second and so for 30 seconds you have 100,8 times of appearance .

Each tx-time per appearance is 3.7 ms.

So we have $100,8 * 3.7 \text{ ms} = 372.96 \text{ ms}$ per 30 seconds.
