## 6 FCC §2.1046, §90.205(p), §90.1215, RSS-111 § 5.3 - Power Spectral Density

### 6.1 Applicable Standards

#### FCC §90.1215

High power devices are also limited to a peak power spectral density of 21 dBm per one MHz. High power devices using channel bandwidths other than those listed above are permitted; however, they are limited to peak power spectral density of 21 dBm/MHz. If transmitting antennas of directional gain greater than 9 dBi are used, both the maximum conducted output power and the peak power spectral density should be reduced by the amount in decibels that the directional gain of the antenna exceeds 9 dBi. However, high power point-to-point and point-to-multipoint operations (both fixed and temporary-fixed rapid deployment) may employ transmitting antennas with directional gain up to 26 dBi without any corresponding reduction in the maximum conducted output power or spectral density. Corresponding reduction in the maximum conducted output power and peak power spectral density should be the amount in decibels that the directional gain of the antenna exceeds 26 dBi.

#### RSS-111 § 5.3

High- and low-power devices are also limited to a maximum power spectral density of 21 dBm/MHz and 8 dBm/MHz respectively. Devices using channel bandwidths other than those listed in Table 1 are permitted; however, the channel bandwidth shall not exceed 20 MHz and the devices shall comply with the maximum power spectral density limits of 21 dBm/MHz for high-power transmitters and 8 dBm/MHz for low-power transmitters. See SP 4940 MHz for antenna gain limits and operational restrictions for the device.

For low-power devices, if a directional antenna is used and its gain exceeds 9 dBi, the transmit power shall be reduced by the same amount that the antenna gain is exceeded.

For high-power fixed point-to-point and point-to-multipoint operations, if the directional antenna gain exceeds 26 dBi, the transmit power shall be reduced by same amount that the antenna gain is exceeded.

### 6.2 Test Procedure

ANSI C63.26-2015 section 5.2.3.5.

### 6.3 Test Setup Block Diagram

## 6.4 Test Equipment List and Details

| BACL No. | Manufacturers   | Descriptions         | Models                     | Serial Numbers             | Calibration Dates      | Calibration Interval |
|----------|-----------------|----------------------|----------------------------|----------------------------|------------------------|----------------------|
| 912      | Rhode & Schwarz | Signal Analyzer      | FSV40                      | 1321.3008k39<br>-101203-UW | 2023-06-02             | 13 months            |
| 1224     | Radiall         | USB COAXIAL SWITCHES | SPNT<br>R574X11X<br>01 USB | -                          | Each time <sup>1</sup> | N/A                  |
| -        | -               | RF Cables            | -                          | -                          | Each time <sup>1</sup> | N/A                  |

Note<sup>1</sup>: Equipment was calibrated for each test.

**Statement of Traceability: BACL Corp.** attests that all of the calibrations on the equipment items listed above were traceable to NIST or to another internationally recognized National Metrology Institute (NMI), and were compliant with the latest version of A2LA policy P102 “A2LA Policy on Metrological Traceability”.

## 6.5 Test Environmental Conditions

|                           |           |
|---------------------------|-----------|
| <b>Temperature:</b>       | 22.4° C   |
| <b>Relative Humidity:</b> | 45.4 %    |
| <b>ATM Pressure:</b>      | 101.8 kPa |

The testing was performed by Kevin Chau from 2024-04-16 to 2024-05-29 in the RF Site.

|      |       | 4980           | 7.63                                | 7.76                                | ≤ 8                |

Note: The total maximum conducted PSD is calculated by converting logarithmic values to linear values, summing them, then converting the sum into logarithmic value like so:  $10 \cdot \text{LOG}(10^{(\text{ant a}/10)} + 10^{(\text{ant b}/10)})$ .

Note: If transmitting antennas of directional gain greater than 9 dBi are used, both the maximum conducted output power and the peak power spectral density limits should be reduced by the amount in decibels that the directional gain of the antennas exceed 9 dBi.

|      |       | 4980           | 4.15                                   | 4.89                                   | 7.546                  | ≤ 8                    |

Note: The total maximum conducted PSD is calculated by converting logarithmic values to linear values, summing them, then converting the sum into logarithmic value like so:  $10 \cdot \text{LOG}(10^{(\text{ant a}/10)} + 10^{(\text{ant b}/10)})$ .

Note: If transmitting antennas of directional gain greater than 9 dBi are used, both the maximum conducted output power and the peak power spectral density limits should be reduced by the amount in decibels that the directional gain of the antennas exceed 9 dBi.

Please refer to below tables for plots.
