4. Operation Mode and Configuration of EUT

Operation Mode

- TX mode
- f = 5.8 GHz
- EUT powered by 12 V DC

Configuration of EUT

EUT was tested in three orthogonal positions and connected to a notebook via RS232.

5. Measuring Methods

5.1. Conducted AC powerline emissions

Rules and Specifications:	CFR 47 Part 15 section 15.207 IC RSS-210 Issue 5 section 6.6
Guide:	ANSI C63.4 (CISPR 22)

Measurement Procedure:
Conducted emission tests in the frequency range 0.15 - 30 MHz are required to be performed with quasi-peak and average detector. To simplify testing the following procedure is used: First the whole spectrum of emission caused by equipment under test (EUT) is recorded with detector set to peak using CISPR bandwidth of 10 kHz. After that all emission levels having less margin than 10 dB to or exceeding the average limit are retested with detector set to quasi-peak. If average limit is kept no additional scan with average detector is necessary. In cases of emission levels between quasi-peak and average limit an additional scan with detector set to average is performed.

5.2. Radiated spurious emissions in fully-anechoic room

Rules and Specifications:	CFR 47 Part 15 section 15.209, 15.249 IC RSS-210 Issue 5 section 6.2.1, 6.2.2(m2)
Guide:	ANSI C63.4

Measurement Procedure:
Radiated emissions are measured over the frequency range from 30 MHz to the maximum frequency as specified in section 15.33. Measurements are made in both the horizontal and vertical planes of polarization in a fully anechoic room using a spectrum analyzer with the detector function set to peak and resolution as well as video bandwidth set to 100 kHz (below 1 GHz) or 1 MHz (above 1 GHz). All tests are performed preferably at a test-distance of 3 meters. If other distances have to be used this is stated on the appropriate test records and the reading values are calculated according to 15.31(f)(1). Hand-held or body-worn devices are rotated through three orthogonal axes to determine which attitude and configuration produces the highest emission relative to the limit and therefore shall be used for final testing. For final testing below 1 GHz an open-area test-site is used and the plots recorded in the fully-anechoic room are indicated as prescans. During the tests the EUT is rotated all around to find the maximum levels of emissions. The cables and equipment are placed and moved within the range of position likely to find their maximum emissions. If required preamplifiers are used for the whole frequency range. Special care is taken to avoid overload (using appropriate attenuators and filters if necessary).

5.3. Radiated spurious emissions at Open Area Test Site

Rules and Specifications:	CFR 47 Part 15 section 15.209, 15.249 IC RSS-210 Issue 5 section 6.2.1, 6.2.2(m2)
Guide:	ANSI C63.4

Measurement Procedure:
Radiated emissions at open area test site are measured in the frequency range 30 MHz to 1 GHz. The measurement bandwidth of the test receiver is set to 120 kHz with detector set to quasi-peak. Hand-held or body-worn devices are tested in the position producing the highest emission relative to the limit as verified by prescans in the fully-anechoic room. EUT is rotated all around and receiving antenna is raised and lowered to find the maximum levels of emission. The cables and equipment are placed and moved within the range of position likely to find their maximum emissions. In general a test-distance of 3 meters is selected. If a test-distance of 10 meters is used the limits are calculated according to 15.31 (d) and (f)(1). If required preamplifiers are used for the whole frequency range. Special care is taken to avoid overload (using appropriate attenuators and filters if necessary).

Conducted Emission Test 150 kHz - 30 MHz according to FCC Part 15 Subpart C

Model:
MDAV5 Ceramic antenna

Serial no.:
SRIF 2002 X4 module No.01298

Applicant:
Siemens AG, Nürnberg

Test site:
Shielded room, cabin no. 2

Tested on:
Linecord EUT Power supply
Phase L1

Date of test: 08/18/2003 Operator: T. Eberl

Test performed: automatically File name:
