1 Scope

This test report contains results measured on BreezeACCESS VL System with radio redesigned (permissible change) according to the relevant requirements of CFR 47 FCC Part 15 Subpart C.

2 General

2.1 Permissible change description

The BreezeAccess VL radio is based on the Atheros chip set that includes the MAC and the radio section. The permissive change is a modification of the front end transmit section to a low cost radio solution. The major change was in the power amplifier section where the transistor power amplifier lineup was replaced by a single MMIC giving the same operational output power and lower power consumption. There was no change in the Atheros chip set that contains all up and down converters and all frequency sources of the unit.

4.4 Radiated emission test, general requirements:

4.4.1 Requirements:

EUTs radiated emission shall not exceed value required in section 15.209 (a).

4.4.2 Test description:

The measurements were performed at the Open Area Test Site.

The test configuration is shown in Fig.1, 2.

The EUT was arranged on a non-metallic table 0.8 m placed on the turn-table.

The measurements were performed at a 10 m measurement distance.

The Bilog 30 MHz-2 GHz antenna was used.

The frequency range was investigated from 30 MHz to 2GHz.

The measurements were performed at each frequency at which the signal was 10 dB below the limit or less.

The level were maximized by initially rotating turntable through 360°, varying the antenna height between 1 m and 4 m, rerouting EUT cables and changing antenna polarization from vertical to horizontal. The measuring equipment settings were:

Initial scan:

Detector type	Peak
Mode	Max hold
Bandwidth	120 kHz
Step size	Continuous sweep
Sweep time	>1 seconds/MHz

Measurements:

Detector type	Quasi-peak (CISPR 16)
Bandwidth	120 kHz
Measurement time	20 seconds/MHz
Observation	>15 seconds

Note 1: Emission level = E Reading (dB μ V) + Cable loss (dB) + Antenna Factor (dB/m) + 10 dB

Where 10 dB is an extrapolation distance factor.

For Cable Loss and Antenna Factor refer to Appendix 2.

Note 2: Margin (dB) = Limit (dB μ V/m) – Emission level (dB μ V/m)

4.5 Radiated emission test on Radio Unit - spurious:

4.5.1 Requirements:

The levels of any unwanted emission shall not exceed value required in section 15.209.

4.5.2 EUT configuration:

The radio unit was tested with four various antennas (see sec.2.2)

- MTI sector antenna
- Unidirectional antenna UNI-28-4
- Unidirectional antenna UNI-28-5.8
- MAXRAD Omni antenna.

4.5.3 Test procedure:

The measurements were performed in the anechoic chamber.

The EUT was arranged on a non-metallic table 0.8 m placed on the turntable.

Measuring antennas used: Up to 18 GHz - Double Ridge **EMCO** model 3115
above 18 GHz - Alpha TRG model A361

Antenna height = 1 m.

Polarization: Vertical/Horizontal

Measurement distance = 1m.

The frequency range was investigated up to 40 GHz.

The measurements were performed in vertical and horizontal polarization, the maximum reading recorded.

Measuring detector function and bandwidths:

Detector type	Peak
Resolution bandwidth	1MHz
Video bandwidth	1 MHz
Detector type	Average
Resolution bandwidth	1MHz
Video bandwidth	3 kHz*

4.5.4 Radiated emission test results and calculation ratio:

The test results are shown in Tables ## 2-5.

The emission level was calculated as:

E Reading (dB μ V) + measuring cable loss (dB) + measuring antenna factor (dB/m) + Distance correction factor

For measuring cable loss and measuring antenna factor refer to Appendix 2.

Distance correction factor = -9.5 dB (an extrapolation reading from 1 m measuring distance to 3m specified distance)

4.7 Conducted emission tests on Radio Unit:

4.7.1 Maximum peak output power

Requirements:

The maximum peak output power shall not exceed 1 Watt as required in sec. 15.247 (b) (1).

Test results:

The measurements were taken at three carrier frequencies, in the band 30 MHz – 26 GHz and in the band 26 GHz – 40 GHz.

Calculations:

1. Maximum setting of RBW=VBW is 3MHz
2. 6dB band width = 18MHz @ RBW=VBW=3MHz.
3. Peak power measured = 21.3dBm.
4. Peak power calculation = $21.3 + 10 \cdot \log(18/3) = 29\text{dBm}$

The measured results are shown in Plots #21 to #29.

The maximum peak output power in range 30 MHz – 40 GHz does not exceed 30 dBm (1 Watt).

4.7.2 Spurious

Requirements:

In any 100 kHz bandwidth outside the frequency band in which the intentional radiator is operating, the RF power shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, as required in sec. 15.247 (c).

Test results:

The measured results are shown in Plots #30 to #31.

4.7.3 Peak power spectral density

Requirements:

The peak power spectral density shall not be greater than 8dBm in any 3kHz band as required in section 15.247 (d).

Test results:

The measured results are shown in Plots #32- #34
