NAME OF TEST:

OUT OF BAND EMISSIONS

PARAGRAPH:

15.247(c), 15.209(a)

TEST CONDITIONS:

STANDARD TEMPERATURE AND HUMIDITY

SPEC. LIMIT:

SEE BELOW

TEST EQUIPMENT:

AS PER PREVIOUS PAGE

SEARCH ANTENNAS:

10 kHz - 32 MHz: LOOP 94593-1
32 MHz - 1 GHz: SINGER DM105, T₁T₂T₃
1 GHz - 18 GHz: EMCO 3115

LIMIT

In any 100 kHz bandwidth outside these frequency bands, radio frequency power that is produced by the modulation products of the spreading sequence, information sequence, and the carrier frequency shall be either
at least 20 dB below that in any 100 kHz bandwidth within the band that contains the highest level of the desired power

or

shall not exceed the general levels specified in 15.209(a),
whichever results in the lesser attenuation.
All other emissions outside these bands shall not exceed the general radiated emission limits specified in 15.209(a).

MEASUREMENT PROCEDURE:

At first, bench tests were performed to locate the emissions at the antenna terminals.

In the field, tests were conducted over the range shown. The test sample was set up on a wooden turntable above ground, and at a distance of three meters from the antenna connected to the spectrum analyzer.

In order to obtain the maximum response at each frequency, the turntable was rotated, and the search antenna was raised and lowered. The E.U.T. was also adjusted for maximum response.

The field strength was calculated from:

$$E \text{ } \mu\text{V/m @ 3 m} = \text{LOG}_{10}^{-1} \left(\frac{\text{dBm} + 107 + \text{A.F.} + \text{C.L.}}{20} \right)$$

The following results are worst case conditions. Tests were conducted in Horizontal & Vertical polarization modes.

MEASUREMENT PROCEDURE

The EUT was set up on a three meter open field site according to the procedures on ANSI C63.4.

Sensitivity of system was measured:

Below 2 GHz:

HP 8566B/HP85685A
CISPR Bandwidths = 8 dBμV
1 MHz RBW, 1 MHz VBW = 12 dBμV
1 MHz RBW, 10 Hz VBW = 3 dBμV

Above 2 GHz:

HP 8563E
1 MHz RBW, 1 MHz VBW = 33 dBμV
1 MHz RBW, 10 Hz VBW = 22 dBμV

Sensitivity of system with preamps (HP 8449A):

Below 2 GHz:

Preamps are not used in this range.

Above 2 GHz:

HP 8563E
Peak - 3 dBμV
Average - 8 dBμV

Cable loss:

915 MHz = -0.8 dB
2450 MHz = -3 dB

Note:

dB loss vs. frequency included in programmed software.

Reference Level Offset:

set @ 1 dB, accounts for cable and connector loss.

TEST RESULTS: No harmonic or spurious emissions were detected in the restricted bands in excess of the limits of 15.205. System measurement sensitivity was -130 dBm.

NAME OF TEST:

SPREAD SPECTRUM TECHNOLOGY
FREQUENCY HOPPING SYSTEMS

15.247(a)(1) Channel Separation

LIMIT: 25 kHz minimum or 20 dB Bandwidth of the hopping channel, whichever is greater.

RESULTS: See attached plot

15.247(a)(1) Hopping Sequence Description

LIMIT: Hopping channels must be selected from a psuedorandom ordered list of of frequencies.

RESULTS: See applicant's statement

15.247(a)(1) Reuse Rate Description

LIMIT: Each frequency must be used equally on the average by each transmitter.

RESULTS: See applicant's statement

15.247(a)(1) System Receiver Compatibility and Correlation

LIMIT: Receiver bandwidths must match the hopping bandwidths of their corresponding transmitters & shall shift frequencies in synchronization with the transmitted signal.

RESULTS: The system was operated and found to stay in sync.

15.247(a)(1)(i)&(ii) Number of Hopping Frequencies

LIMIT: 902-928 MHz band: ≥ 50 (if Channel BW < 250 kHz)
902-928 MHz band: ≥ 25 (if Channel BW ≥ 250 kHz)
2400-2483.5, 5725-5850 MHz band: ≥ 75

RESULTS: See applicant's statement

15.247(a)(1)(i)&(ii) Maximum 20 dB Bandwidth

LIMIT: Channel bandwidth ≤ 500 kHz

RESULTS: Please see results for "Allowed Occupied Bandwidth."

15.247(a)(1)(i)&(ii) Average time of Occupancy

LIMIT: 902-928 MHz, ≤ 0.4 seconds in 20 second period.

2400-2483.5, 5725-5850 MHz ≤ 0.4 sec in 30 sec period.

RESULTS: See applicant's statement

All test instrumentation is calibrated every January and every July. In addition, all test instrumentation is calibrated daily, or as required by the manufacturer. A Calibration Agreement is maintained with Hewlett Packard.

OCCUPIED BANDWIDTH

Occupied bandwidth is measured as a radiated signal without attenuators and/or filter. RBW, VBW and scan settings as shown were set to produce a meaningful result in accordance with ANSI C63.4, Section 13.1.7.

Part 15.21, Information to User

The users manual or instruction manual for an intentional or unintentional radiator shall caution the user that changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

THE APPLICANT HAS BEEN CAUTIONED AS TO THE FOLLOWING:

15.21 INFORMATION TO USER.

The users manual or instruction manual for an intentional radiator shall caution the user that changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

15.27(a) SPECIAL ACCESSORIES.

Equipment marketed to a consumer must be capable of complying with the necessary regulations in the configuration in which the equipment is marketed. Where special accessories, such as shielded cables and/or special connectors are required to enable an unintentional or intentional radiator to comply with the emission limits in this part, the equipment must be marketed with, i.e. shipped and sold with, those special accessories. However, in lieu of shipping or packaging the special accessories with the unintentional or intentional radiator, the responsible party may employ other methods of ensuring that the special accessories are provided to the consumer, without additional charge.

Information detailing any alternative method used to supply the special accessories for a grant of equipment authorization or retained in the verification records, as appropriate. The party responsible for the equipment, as detailed in § 2.909 of this chapter, shall ensure that these special accessories are provided with the equipment. The instruction manual for such devices shall include appropriate instructions on the first page of text concerned with the installation of the device that these special accessories must be used with the device. It is the responsibility of the user to use the needed special accessories supplied with the equipment.

§ 15.205 Restricted Bands of operation.

(a) Except as shown in paragraph (d) of this section, only spurious emissions are permitted in any of the frequency bands listed below:

1500-100,000	---	---	1.0	30

f = frequency in MHz

* = Plane-wave equivalent power density

The Uncontrolled Environment represents the most restrictive limits.

IV. Conclusions

In an uncontrolled environment, the maximum permissible exposure from a radio device operating at 2.4 GHz is 1.0 mW/cm² average over a 30 minute period.

In All operating modes, the EUT operates at a level below the required limit.

This analysis indicate a power density for the EUT within the referenced limits.

Since the analysis is favorable in the Uncontrolled Environment, it is unnecessary to analyze for the less restrictive conditions of Controlled Environments or Partial Body Exposure.
