4.8 JUSTIFICATION OF MEASUREMENT PARAMETERS

Several scientific studies show that the electrical field radiated from a leaky coaxial cable has its maximum at a certain angle, which is dependent on the shape and spacing of the slots. E.g. "Wang, J., Y. Li, Z. Zhang, and M. Chen (2011), Radiation mechanism and polarization properties of leaky coaxial cables, Radio Sci., 46, RS2009, doi:10.1029/2010RS004486" <https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1029/2010RS004486>

It is also shown the maximum radiated electrical field is obtained from a superposition of the radiation from several slots.

On the other hand, the signal power in a leaky coax structure is decreasing with the distance due to its longitudinal attenuation (for details please see IEC 61196-1-127: 2024).

Thus, it can be assumed that the maximum radiation from the cable is reached at some distance [D_{MAX}] from the feeding point.

D_{MAX} depends for every leaky coax on the shape and spacing of the single slots in the cable and the emitted frequency.

Because in this Insitu measurements only a single leaky coaxial cable type is investigated, D_{MAX} depends only on the emitted frequency.

Due to the wide investigated frequency range 9 kHz – 40 GHz, which causes a wide variation of D_{MAX} , the worst case search has been performed from the feeding point up to a distance beyond D_{MAX} , where a stable decrease of the emitted power has been measured. This distance [$D_{STABLE\ DECREASE}$] is stated in the measurement data of every test for each location.

The EUT was tested with end-feeding into a single segment RCoax cable. Alternatively, a centre feeding with a power splitter is possible. As a power splitter delivers at least 3 dB less power to each segment, the end-feeding is considered as worst-case configuration with respect to radiated power

5 TEST RESULTS

5.1 MAXIMUM RADIATED OUTPUT POWER

Standard **FCC Part 15 Subpart E**

The test was performed according to:

- Measurement setup: ANSI C63.10, chapter 6.11.3
- Analyser settings: ANSI C63.10, chapter 12.4.2 (SA-2)

5.1.1 TEST DESCRIPTION

The Equipment Under Test (EUT) was installed in a typical installation in the test location. A RCoax cable was connected to one antenna connector (Port A). The other antenna output was terminated with 50 Ohm.

The following information can be found in the description of each measurement location.

- Length of the connected RCoax cable (chapter 3.5)
- Installation height of the RCoax cable (chapter 3.5)
- Length of the feeder cable (chapter 3.5)
- Measurement distance
- Maximum measurement distance from feeding point
- Maximum measurement height of the receiving antenna (during worst-case search)
- Worst-case measurement polarisation

Measurement procedure:

1. Determining of the worst-case position – highest emission of the fundamental for every TX frequency and occupied bandwidth – for both receiving antenna polarisations between:
 - a. Determination of the maximum measurement distance [$D_{\text{STABLE DECREASE}}$] from the feeding point
 - b. Search of worst-case distance between 0.0 m and maximum measurement distance from the feeding point of RCoax cable for both measurement polarisations.
 - c. Height variation of the Receiving antenna: continuously from 1.0 m to maximum receiving antenna height for both polarisations.
 - d. Determination of worst-case receiving antenna polarisation
2. Measurement of the output power at the worst-case position.
3. Measurement of the environmental electromagnetic spectrum – with EUT switched off – at worst-case position for both polarisations.

The results recorded were measured with the modulation which produces the worst-case (highest) output power

The analyser settings were according to FCC Public Note "Guidelines for Compliance Testing of Unlicensed National Information Infrastructure (U-NII) Devices - Part 15, Subpart E, 789033 D02", method **SA-2**.

Analyzer settings:

- Resolution Bandwidth (RBW): 1 MHz
- Video Bandwidth (VBW): 3 MHz
- Trace: Average, RMS power averaging mode
- Sweeps: at least 100
- Sweep time: Auto
- Detector: RMS
- Trigger: free run (DC >98 %)

COMMENT:

- The values of the 99% OBW – to calculate the ISED EIRP limit in subband 1 - have been taken from the original report of the EUT with the reference: MDE_SIEM_1911_FCC_02_REV01
- The spectrum analyser transducer TDF DUT3 contains the attenuation of the measurement cable
- The "Reference Level Offset" in the analyser contains the correction of the far-field attenuation and the gain of the receiving antenna.
Example calculation:
FF-ATT: 51.9 dB (5180 MHz@1.81m), Antenna Gain: 10.0 dB
Reference Level Offset: 51.9 dB -10.0 dB = 41.9 dB

COMMENT:

- The values of the 99% OBW – to calculate the ISED EIRP limit in subband 1 - have been taken from the original report of the EUT with the reference: MDE_SIEM_1911_FCC_02_REV01
- The spectrum analyser transducer "TDF TS DUT CAL" contains the attenuation of the measurement cable
- The "Reference Level Offset" in the analyser contains the correction of the far-field attenuation and the gain of the receiving antenna.
 Example calculation:
 FF-ATT: 62.6 dB (5180 MHz@7.0m), Antenna Gain: 10.0 dB
 Reference Level Offset: 62.6 dB -10.0 dB = 52.6 dB
