Note:

The test results of this test report relate exclusively to the item tested as specified in this report. The CETECOM ICT Services GmbH does not assume responsibility for any conclusions and generalizations drawn from the test results with regard to other specimens or samples of the type of the equipment represented by the test item.

The test report may only be reproduced or published in full. Reproduction or publication of extracts from the report requires the prior written approval of the CETECOM ICT Services GmbH.

During the test no hardware and software changes are allowed to be performed at the EUT.

1.3.3 Additional EUT information

The Siemens A&D PT2 Wireless LAN Product Family „SCALANCE W700 V1“ consists of three variants, namely

- SCALANCE W744-1PRO, 1 WLAN card inside
- SCALANCE W788-1PRO, 1 WLAN card inside
- SCALANCE W788-2PRO, 2 WLAN cards inside

The SCALANCE W788-2PRO is the superset of all variants and include the whole functionality of all three products. This functionality can be divided into

- Simple WLAN client functionality, i.e. the device can bridge Ethernet traffic to a wireless LAN
- Single Access Point functionality
- Access Point functionality supporting two WLAN cells in parallel using two radio interfaces

The SCALANCE W744-1PRO only supports the client functionality. The SCALANCE W788-1PRO includes the single access point functionality and the client mode. The SCALANCE W788-2PRO additionally allows operating two WLAN cells in parallel, since it is fitted with two WLAN radio cards.

All variants are based on the same WLAN chipset (ATHEROS AR5212 + AR5112) and even on the same WLAN minipCI module from Alpha-Networks.

PCB-boards, layout, parts and housing are identical on all three variants, only the SCALANCE W788-2PRO has two additional antenna ports.

The test was performed with two different antennas.

3 RF measurement testing

3.1 Description of test set-up

3.1.1 Radiated measurements

The radiated measurements are performed in vertical and horizontal plane in the frequency range from 9 kHz to 25 GHz in semi-anechoic chambers. The EUT is positioned on a non-conductive support with a height of 0.80 m above a conductive ground plane that covers the whole chamber. The receiving antennas conform with specifications ANSI C63.2-1996 clause 15 and ANSI C63.4-2003 clause 4.1.5. These antennas can be moved over the height range between 1.0 m and 4.0 m in order to search for maximum field strength emitted from EUT. The measurement distances between EUT and receiving antennas are indicated in the test setups for the various frequency ranges. For each measurement, the EUT is rotated in all three axes until the maximum field strength is received. The wanted and unwanted emissions are received by spectrum analysers where the detector modes and resolution bandwidths over various frequency ranges are set according to requirement ANSI C63.4-2003 clause 4.2.

Antennas conform with ANSI C63.2-2003 item 15.

150 kHz - 30 MHz: Quasi Peak measurement, 9kHz Bandwidth, passive loop antenna.

30 MHz - 200 MHz: Quasi Peak measurement, 120KHz Bandwidth, biconical antenna

200MHz - 1GHz: Quasi Peak measurement, 120KHz Bandwidth, log periodic antenna

>1GHz: Average, RBW 1MHz, VBW 10 MHz, waveguide horn with lownoise preamp

3.1.2 Conducted measurements

The EUT's RF signal is coupled out by the antenna connector which is supplied by the manufacturer. The signal is connected to the spectrum analyzer. The specific losses for signal paths are first checked within a calibration. The measurement readings on the spectrum analyzer are corrected by the specific test set-up loss. The attenuator, power divider, signaling unit and the spectrum analyzer are impedance matched on 50 Ohm.

3.1.3 AC-conducted measurements

As the product is sold without any power supply, we used a power supply from our company to show compliance with AC-conducted requirements.

3.4 Antenna gain

Antenna 1: ANT 792-4DN single band antenna

-Max gain at 2,4 GHz = 4.2 dBi

Antenna 2: ANT 792-8DR (delivered with a 5m fix mounted coax cable)

-Max gain at 2,4 GHz = 10.6 dBi

This antenna is dedicated for fixed point to point operation.

The nominal gain of this antenna is 10.6 dBi. This causes a reduction of 2 dB of the maximum conducted power from 30 dBm to 28 dBm.

Antenna diagrams see Annex 1:

3.5 RF EXPOSURE INFO for high gain antenna

Environmental evaluation measurements of Maximum Permissible Exposure (MPE) to radio frequency (RF) radiation from transmitting devices for compliance with the technical rules and regulations of the U.S. Federal Communications Commission and Industry Canada.

Description of EUT

Siemens AG Model: wireless AP/Client with antenna type ANT792-8DR including 5m coax cable.

- 1) The probe was positioned on a table at a separation distance of 20 cm from the radiating antenna and at a starting height of 5 cm to the center of the probe.
- 2) The table was positioned so that the initial start angle was 0 degrees.
- 3) The EUT was powered on and allowed sufficient time to stabilize. The EUT was operated at full power on a desired frequency.
- 4) The analyzer and the field probe was set for maximum hold, and set on the appropriate power range.
- 5) The table was rotated 360 degrees and the maximum reading was obtained for that elevation.
- 6) The antennas were lifted and lowered at maximum value in the horizontal plane to find the maximum in vertical position.

Result:

The max measured MPE value on a distance of 20 cm is:

0.37 mW/cm² by measurement with the analyzer

0.33 mW/cm² by measurement with the field probe

MPE System Specification:

- Electromagnetic Radiation Field probe, PMM Model 8053
Frequency Range: 1 MHz to 40 GHz
Calibration date: 05/2005
- Signal analyzer FSIQ26 from R&S
Frequency range: 10 Hz to 26.5 GHz
Calibration date: 09/2006

Limit:

1mW/ cm ² is the reference level for general public exposure according to the OET Bulletin 65, Edition 97-01 Table 1.
