

FCC/IC Test Report

For

Industrial Remote Control

Model Number : Alpha 604AJ, Alpha 604BJ

FCC ID : LZ6ALPHA604XJ

IC : 2383A-A604XJ

Report Number : S3RF-A340-1205-081

Date of Receipt : April 26, 2021

Date of Report : July 8, 2021

Prepared for

Fomotech International Corp.

2F-1, 286-3, Hsin Ya Road, Chien Chen District, Kaohsiung City 806, Taiwan, R.O.C.

Prepared by

Central Research Technology Co.

11, Lane 41, Fushuen St., Jungshan Chiu, Taipei 104, Taiwan

This report shall not be reproduced, except in full, without written approval of Central Research Technology Co.. It may be duplicated completely in its entirety for legal use with the permission of the applicant. The test result in this report is based on the information provided by manufacturer and applies only to the sample tested.

Verification of Compliance

Equipment under Test : Industrial Remote Control
Model No. : Alpha 604AJ, Alpha 604BJ
FCC ID : LZ6ALPHA604XJ
IC : 2383A-A604XJ
Manufacturer : Fomotech International Corp.
Applicant : Fomotech International Corp.
Address : 2F-1, 286-3, Hsin Ya Road, Chien Chen District, Kaohsiung City
806, Taiwan, R.O.C.
Applicable Standards : 47 CFR part 15, Subpart C
ANSI 63.10:2013
RSS-247 Issue 2
RSS-Gen Issue 5
Date of Testing : April 28 ~ June 18, 2021
Deviation : The method, configuration and arrangement of the tests are following the requirement of customer and the applicable standards cited above.
Condition of Test Sample : Mass Production

We, **Central Research Technology Co.**, hereby certify that one sample of the designated product was tested in our facility during the period mentioned above. The test records, data evaluation and Equipment Under Test (EUT) configurations shown in the present report are true and accurate representation of the measurements of the sample's RF characteristics under the conditions herein specified.

The test results show that the EUT as described in the present report is in compliance with the requirements set forth in the standards mentioned above and apply to the tested sample identified in the present report only. The test report shall not be reproduced, except in its entirety, without the written approval of Central Research Technology Co.

1 General Description

1.1 General Description of EUT

Equipment under Test : Industrial Remote Control
Model No. : Alpha 604AJ, Alpha 604BJ
Power in : 3Vdc (Transmitter)
Test Voltage : 3Vdc by battery (Transmitter) ,
Manufacturer : Fomotech International Corp.
Channel Numbers : 50
Frequency Range : 902~928MHz
Modular Function : GFSK
Antenna Spec : Antenna Gain : 0dBi

Since the transmitter is considered a portable unit, it was pre-tested on the positioned in each of 3 axis.It was found that the Z Axis was the worst. It was taken as the representative condition for testing and its data are recorded in the present document.

Channel List:

Frequency (MHz)	Channel	Frequency (MHz)	Channel	Frequency (MHz)	Channel
903.0	1	911.5	18	920.0	35
903.5	2	912.0	19	920.5	36
904.0	3	912.5	20	921.0	37
904.5	4	913.0	21	921.5	38
905.0	5	913.5	22	922.0	39
905.5	6	914.0	23	922.5	40
906.0	7	914.5	24	923.0	41
906.5	8	915.0	25	923.5	42
907.0	9	915.5	26	924.0	43
907.5	10	916.0	27	924.5	44
908.0	11	916.5	28	925.0	45
908.5	12	917.0	29	925.5	46
909.0	13	917.5	30	926.0	47
909.5	14	918.0	31	926.5	48
910.0	15	918.5	32	927.0	49
910.5	16	919.0	33	927.5	50
911.0	17	919.5	34		

1.2 Test Mode

Test item	Test frequency
Conducted power test	902 MHz, 915 MHz, 927.5 MHz
Radiated emission below 1 GHz	902 MHz
Radiated emission above 1 GHz	902 MHz, 915 MHz, 927.5 MHz

EUT Test step:

1. Adjust test channel.
2. Turn on the power.
3. EUT transmit signal.

1.3 Applied standards

(1) 20 dB Bandwidth

According to FCC 15.247(a)(1)(i) and RSS-247 5.1(c), the maximum allowed 20 dB bandwidth of the hopping channel is 500 kHz.

(2) Hopping number and Time of occupancy

According to FCC 15.247(a)(1)(i) and RSS-247 5.1(c), for frequency hopping systems operating in the 902-928 MHz band: if the 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall use at least 50 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 20 second period; if the 20 dB bandwidth of the hopping channel is 250 kHz or greater, the system shall use at least 25 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 10 second period.

(3) Hopping separation

According to FCC 15.247(a)(1) and RSS-247 5.1(b), frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater.

(4) Maximum Peak Output Power

According to FCC 15.247(b) (1) For frequency hopping systems operating in the 2400-2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725-5850 MHz band: 1 watt. For all other frequency hopping systems in the 2400-2483.5 MHz band: 0.125 watts.(2) For frequency hopping systems operating in the 902-928 MHz band: 1 watt for systems employing at least 50 hopping channels; and, 0.25 watts for systems employing less than 50 hopping channels, but at least 25 hopping channels, as permitted under paragraph (a)(1)(i) of this section. According to RSS 247 5.4(a), For FHSs operating in the band 902-928 MHz, the maximum peak conducted output power shall not exceed 1.0 W, and the e.i.r.p. shall not exceed 4 W if the hopset uses 50 or more hopping channels; the maximum peak conducted output power shall not exceed 0.25 W and the e.i.r.p. shall not exceed 1 W if the hopset uses less than 50 hopping channels.

(5) 100 kHz bandwidth outside of band

According to FCC 15.247(d) and RSS-247 5.5, In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph FCC 15.247(b)(3) and RSS-247 5.4(d), the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in FCC 15.209(a) and RSS-Gen are not required. Radiated emissions which fall in the restricted bands, as defined in FCC 15.205(a) RSS-Gen 8.10, must also comply with the radiated emission limits specified in FCC 15.209(a) and RSS-Gen 8.9.

(6) 99% Occupied Bandwidth

According RSS-Gen 6.7, when the occupied bandwidth limit is not stated in the applicable RSS or reference measurement method, the transmitted signal bandwidth shall be reported as the 99% emission bandwidth, as calculated or measured.

(7) Radiated emission measurements

For intentional device, according to FCC 15.209 and RSS-Gen 8.9, the general requirement of field strength of radiated emissions from intentional radiator at a distance of 3 meters shall not exceed the below table.

Frequency (MHz)	Measurement Distance (m)	Field Strength (uV/m)	Field Strength (dBuV/m)
0.009-0.490	300	2400/F(kHz)	
0.490-1.705	30	24000/F(kHz)	
1.705-30.0	3	30	29.5
30 – 88	3	100	40.0
88 – 216	3	150	43.5
216 – 960	3	200	46.0
above 1610	3	500	54.0

Note1 : At frequencies at or above 30 MHz, measurements may be performed at a distance other than what is specified provided: measurements are not made in the near field except where it can be shown that near field measurements are appropriate due to the characteristics of the device; and it can be demonstrated that the signal levels needed to be measured at the distance employed can be detected by the measurement equipment. When performing measurements at a distance other than that specified, the results shall be extrapolated to the specified distance using an extrapolation factor of 20 dB/decade (inverse linear-distance for field strength measurements; inverse-linear-distance-squared for power density measurements).

Note 2: At frequencies below 30 MHz, measurements may be performed at a distance closer than that specified in the regulations; however, an attempt should be made to avoid making measurements in the near field. Pending the development of an appropriate measurement procedure for measurements performed below 30 MHz, when performing measurements at a closer distance than specified, the results shall be extrapolated to the specified distance by either making measurements at a minimum of two distances on at least one radial to determine the proper extrapolation factor or by using the square of an inverse linear distance extrapolation factor (40 dB/decade)

(8) Restricted Band

Frequency (MHz)	Frequency (MHz)	Frequency (MHz)	Frequency (GHz)
0.090 - 0.110	16.42 - 16.423	399.9 - 410	4.5 - 5.15
¹ 0.495 - 0.505	16.69475 - 16.69525	608 - 614	5.35 - 5.46

Note:

1. The calibrations are traceable to NML/ROC.
2. NCR : No Calibration Required.
3. The calibration date of the chamber TR1 listed above is the date of site VSWR measurement.

1.8 Test Capability

Test Facility

The test facility used for evaluating the conformance of the EUT with each standard in the present report meets what required in CISPR16 series and ANSI C63.4:2014 amended as per ANSI 63.4a:2017.

Test Room	Type of Test Room	Descriptions
TR1	10m semi-anechoic chamber	For the radiated emission measurement (below 1GHz)
TR1	3m fully-anechoic chamber	For the radiated emission measurement (above 1GHz)
TR11	3m semi-anechoic chamber	For the radiated emission measurement (below 1GHz)
TR13	Test Site	For the RF conducted emission measurement.
TR5	Shielding Room	For the conducted emission measurement.
TR20	Shielding Room	

Test Laboratory Competence Information

Central Research Technology Co. has been accredited / filed / authorized by the agencies listed in the following table.

Certificate	Nation	Agency	Code	Mark
Accreditation Certificate	USA	NVLAP	200575-0	ISO/IEC 17025

1.9 Measurement Uncertainty

The assessed measurement uncertainty with a suitable coverage factor K to ensure 95% confidence level for the normal distribution are shown as below, the values are less than U_{CISPR} in table 1 of CISPR 16-4-2.

Test Item	Measurement Uncertainty	
Radiated Emission: (9kHz~30MHz)	Horizontal 3.92dB ; Vertical 3.92dB	
Radiated Emission: (30MHz~1000MHz)	Horizontal 4.42dB ; Vertical 5.98dB	
Radiated Emission: (1GHz~6GHz)	Horizontal 4.60dB ; Vertical 4.48dB	
Radiated Emission: (6GHz~18GHz)	Horizontal 4.66dB ; Vertical 4.58dB	
Radiated Emission: (18GHz~40GHz)	Horizontal 4.74dB ; Vertical 4.76dB	
Line Conducted Emission	NSLK-8128-RC	2.48 dB
	ENV 4200	2.52 dB
	ESH2-Z5	2.20 dB

2 20dB Bandwidth

Result: Pass

2.1 Applied standard

According to According to FCC 15.247(a)(1)(i) and RSS-247 5.1(c),and The maximum allowed 20 dB bandwidth of the hopping channel is 500 kHz.

2.2 Measurement Procedure

- a. The EUT was set up per the test configuration figured in the next section of this chapter to simulate the typical usage per the user's manual.
- b. A software provided by client enabled the EUT to transmit data at middle channel frequencies individually.
- c. Test procedures follow ANSI C63.10 Section 6.9.
- d. Measure the 20dB bandwidth and compare with the required limit.

2.3 Test configuration

2.4 Test Data

Test Mode : Continuous Transmitting
Ambient Temperature : 26°C

Tester : Wayne
Relative Humidity : 65%

Operating Frequency (MHz)	20 dB Bandwidth (kHz)	Limit (kHz)
903	468	500
915	468	500
927.5	465	500

903 MHz

3 Hopping Channel and Time of Occupancy

Result: Pass

3.1 Applied standard

According to FCC 15.247(a)(1)(i) and RSS-247 5.1(c), for frequency hopping systems operating in the 902-928 MHz band: if the 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall use at least 50 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 20 second period; if the 20 dB bandwidth of the hopping channel is 250 kHz or greater, the system shall use at least 25 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 10 second period.

3.2 Measurement Procedure

- a. The EUT was set up per the test configuration figured in the next section of this chapter to simulate the typical usage per the user's manual.
- b. Test procedures follow ANSI 63.10 section 7.8.3.
- c. Measurement the hopping channel and Time of occupancy and compare with the required limit.

3.3 Test configuration

3.4 Test Data

Hopping Channel

Test Mode : Hopping
Ambient Temperature : 26°C

Tester : Wayne
Relative Humidity : 65%

Hopping number is 50 which is greater than limit 25.

Time of Occupancy

Test Mode : Hopping
Ambient Temperature : 26°C

Tester : Wayne
Relative Humidity : 65%

Operating Frequency (MHz)	Occupancy of hop (ms)	Number of hops @ 1s	Tiem of occupancy @10 s (ms)	Limit (s)
915	1.91	14	267.4	0.4

4 Hopping Separation

Result: Pass

4.1 Applied standard

According to FCC 15.247(a)(1) and RSS-247 5.1(b), frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater.

4.2 Measurement Procedure

- a. The EUT was set up per the test configuration figured in the next section of this chapter to simulate the typical usage per the user's manual.
- b. Test procedures follow ANSI 63.10 section 7.8.2
- c. Measure the hopping separation and compare with the required limit.

4.3 Test configuration

4.4 Test Data

Test Mode : Continuous transmitter
Ambient Temperature : 26°C

Tester : Wayne
Relative Humidity : 65%

Operating Frequency (MHz)	Hopping separation (kHz)	Limit (kHz)
903	506.5	468
915	505.5	468
927.5	507.5	468

903 MHz

915 MHz

927.5 MHz

5 Output power

Result: Pass

5.1 Applied standard

According to FCC 15.247(b) (2) For frequency hopping systems operating in the 902-928 MHz band: 1 watt for systems employing at least 50 hopping channels; and, 0.25 watts for systems employing less than 50 hopping channels, but at least 25 hopping channels, as permitted under paragraph (a)(1)(i) of this section. According to RSS 247 5.4(a), For FHSs operating in the band 902-928 MHz, the maximum peak conducted output power shall not exceed 1.0 W, and the e.i.r.p. shall not exceed 4 W if the hopset uses 50 or more hopping channels; the maximum peak conducted output power shall not exceed 0.25 W and the e.i.r.p. shall not exceed 1 W if the hopset uses less than 50 hopping channels.

5.2 Measurement Procedure

- d. The EUT was set up per the test configuration figured in the next section of this chapter to simulate the typical usage per the user's manual.
- e. Test procedures follow ANSI 63.10 section 7.8.5
- f. Measure the output power and compare with the required limit.

5.3 Test configuration

5.4 Test Data

Test Mode : Continuous transmitter

Tester : Wayne

Ambient Temperature : 26°C

915 MHz

927.5 MHz

6 RF Antenna Conducted spurious

Result: Pass

6.1 Applied standard

According to FCC 15.247(d) and RSS-247 section 5.5, In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph FCC 15.247(b)(3) and RSS-247 section 5.4(4), the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in FCC 15.209(a) and RSS-Gen are not required.

6.2 Measurement Procedure

- a. The EUT was set up per the test configuration figured in the next section of this chapter to simulate the typical usage per the user's manual.
- b. The software provided by client enabled the EUT to transmit data at low and high channel frequencies individually.
- c. Test procedures follow ANSI 63.10 section 7.8.6.
- d. Measurement the conducted spurious and compare with the required limit.

7 Radiated Emission

Result: Pass

7.1 Applied standard

According to FCC 15.247(d) and RSS-247 section 5.5, fall in the restricted bands, as defined in FCC 15.205(a) RSS-Gen section 8.10, must also comply with the radiated emission limits specified in FCC 15.209(a) and RSS-Geb section 8.9.

7.2 Measurement Procedure

- a. The EUT was set up per the test configuration figured in the next section of this chapter to simulate the typical usage per the user's manual.
- b. A software provided by client enabled the EUT to transmit and receive data at operating frequency.(if necessary)
- c. If the EUT is tabletop equipment, it should be placed on a wooden table with a height of 0.8 meters above the reference ground plane in the semi-anechoic chamber. If the EUT is floor-standing equipment, it should be placed on a non-conducted support with a height of 12 millimeters above the reference ground plane in the semi-anechoic chamber.
- d. The EUT is set 3m away from the interference receiving antenna.
- e. Rapidly sweep the signal in the test frequency range by using the spectrum through the Maximum-peak detector.
- f. Rotate the EUT from 0° to 360° and position the receiving antenna at heights from 1 to 4 meters above the reference ground plane continuously to determine at least six frequencies associated with higher emission levels and record them.
- g. Then measure each frequency found from step f. by using the spectrum with rotating the EUT and positioning the receiving antenna height to determine the maximum level.
- h. For measurement of frequency below 1000MHz, set the receiver detector to be Quasi-Peak per CISPR 16-1 to find out the maximum level occurred.
- i. For measurement of frequency above 1000MHz, set the spectrum detector to be Peak or Average to find out the maximum level occurred, if any.
- j. Record frequency, azimuth angle of the turntable, height, and polarization of the receiving antenna and compare the maximum level with the required limit.
- k. Change the receiving antenna to another polarization to measure radiated emission by following step e. to j. again.
- l. If the peak emission level below 1000MHz measured from step f. is 4dB lower than the limit specified, then the emission values presented will be the peak value only. Otherwise, accurate Q.P. value will be measured and presented.
- m. If the peak emission level above 1000MHz measured from step f. is 20dB lower than the limit specified, then the emission values presented will be the peak value only. Otherwise, accurate A.V. value will be measured and presented.

8 Occupied Bandwidth

Result: Pass

8.1 Applied Standard

According RSS-Gen section 6.7, when the occupied bandwidth limit is not stated in the applicable RSS or reference measurement method, the transmitted signal bandwidth shall be reported as the 99% emission bandwidth, as calculated or measured.

8.2 Measurement Procedure

- The EUT was set up per the test configuration figured in the next section of this chapter and to simulate the typical usage described in the user's manual supported by the manufacturer in chamber TR13.
- Measure the 99% bandwidth by using the spectrum analyzer and following the test conditions described in RSS-Gen.
- Record the frequency and compare with the required limit.
