

Product Description

The EUT is a low power 125 kHz transmitter.

RF IDEas offers the pcPROXC as a computer access control, logon capability, and identification means for existing Casi Rusco proximity badge holders. The pcProx frees the user from entering passwords and ID codes. When the user presents their badge to the pcProxc reader, it detects the user's badge and sends the badge information to the computer. This information can be used for logon, audit, and identification or for various other utility functions.

The EUT connects to computers via a 9 pin serial port and a PS/2 keyboard port. The EUT has a pass through PS/2 connector. The EUT is powered from the keyboard connector.

The EUT will only be marketed to corporations. It works in conjunction with security systems in offices and factories.
