ENGINEERING STATEMENT

For Certification of

WIRELESS MARKETING CORPORATION

Model No. GR-823
FCC ID: MGPGR-823

I am an Electronics Engineer, a principal in the firm of Hyak Laboratories, Inc., Springfield, Virginia. My education and experience are a matter of record with the Federal Communications Commission.

Hyak Laboratories, Inc. has been authorized by Wireless Marketing Corporation to make certification measurements on the GR-823 transceiver. These tests were made by me or under my supervision in our Springfield laboratory.

Test data and documentation required by the FCC for certification are included in this report. The data verifies that the above mentioned transceiver meets FCC requirements and certification is requested.

Rowland S. Johnson

Dated: September 27, 1999

A. INTRODUCTION

The following data are submitted in connection with this request for type acceptance of the GR-823 transceiver in accordance with Part 2, Subpart J of the FCC Rules.

The GR-823 is a hand-held, battery operated, UHF, frequency modulated, 2 W transceiver intended for voice communications applications in the 462.5500 - 467.7250 MHz band under Part 95 in the GMRS service.

B. GENERAL INFORMATION REQUIRED FOR TYPE ACCEPTANCE
(Paragraph 2.983 of the Rules)

1. Name of applicant: Wireless Marketing Corporation
2. Identification of equipment: FCC ID: MGPGR-823
 - a. The equipment identification label is shown in Appendix 1.
 - b. Photographs of the equipment are included in Appendix 2.
3. Quantity production is planned.
4. Technical description:
 - a. 16k0F3E emission
 - b. Frequency range: 462.5500-467.7250 MHz.
 - c. Operating power of transmitter is fixed at the factory at 2 watts.
 - d. Maximum power permitted under FCC Part 95 (interstitial) is 5 watts ERP. The GR-823 fully complied with that power limitation.
 - e. The dc voltage and dc currents at final amplifier:

Collector voltage: 7.1 Vdc
Collector current: 0.590 A
 - f. Function of each active semiconductor device:
See Appendix 3.
 - g. Complete circuit diagram is included in Appendix 4.
 - h. A draft instruction book is submitted as Appendix 5.
 - i. The transmitter tune-up procedure is included in Appendix 6.
 - j. A description of circuits for stabilizing frequency is included in Appendix 7.
 - k. A description of circuits and devices employed for suppression of spurious radiation and for limiting modulation is included in Appendix 8.
 - l. Not applicable.

B. GENERAL INFORMATION REQUIRED FOR TYPE ACCEPTANCE (Continued)

5. Data for 2.985 through 2.997 follow this section.

C. RF POWER OUTPUT (Paragraph 2.985(a) of the Rules)

RF power output was measured with a Bird 4421 RF power meter and a Narda 765-20 attenuator as a 50 ohm dummy load. Maximum power was 2.0 watts. (The transmitter was tuned by the factory according to the procedure of Exhibit 4.)

D. MODULATION CHARACTERISTICS

1. A curve showing frequency response of the transmitter is shown in Figure 1. Reference level was audio signal output from a Boonton 8220 modulation meter with one kHz deviation. Audio output was measured with a Audio Precision System One TRMS voltmeter and tracking generator.

2. Modulation limiting curves are shown in Figure 2, using a Boonton 8220 modulation meter. Signal level was established with a Audio Precision System One. The curves show compliance with paragraphs 2.987(b) and 95.633(b).

3. Figure 3 is a graph of the post-limiter low pass filter which meets the requirements of paragraph 95.633(b) in providing a roll-off of $60\text{Log}f/3$ dB where f is audio frequency in kHz. Measurements were made following EIA RS-152B with an Audio Precision System One on the Boonton 8220 modulation meter audio output.

4. Occupied Bandwidth
(Paragraphs 2.989(c), 90.209(b)(4), and 95.629(a) of the Rules)

Figure 4 is a plot of the sideband envelope of the transmitter output taken with a Tektronix 494P spectrum analyzer. Modulation corresponded to conditions of 2.989(c)(1) and consisted of 2500 Hz tone at an input level 16 dB greater than that necessary to produce 50% modulation at 2657 Hz, the frequency of maximum response. Measured modulation under these conditions was 4.4 kHz.

The plot is within the limits imposed by Paragraph 90.211(h) for frequency modulation. The horizontal scale (frequency) is 10 kHz per division and the vertical scale (amplitude) is a logarithmic presentation equal to 10 dB per division.

5. Emission Designator Calculation:

$$(2D + 2F) \quad 2 \times 5.0 + 2 \times 3.0 = 16\text{k}0\text{F}3\text{E}$$

E. SPURIOUS EMISSIONS AT THE ANTENNA TERMINALS
(Paragraph 2.991 of the Rules)

The GR-823 transmitter was tested for spurious emissions at the antenna terminals while the equipment was modulated with a 2500 Hz signal, 16 dB above minimum input signal for 50% (2.5 kHz deviation) modulation at 2657 Hz, the frequency of highest sensitivity.

Measurements were made with Tektronix 494P spectrum analyzer coupled to the transmitter output terminal through Narda 765-20 microwave power attenuator.

During the tests, the transmitter was terminated in the 50 ohm attenuator. Power was monitored on a Bird 43 Thru-Line wattmeter; dc supply was 7.2 volts throughout the tests.

Spurious emissions were measured throughout the RF spectrum from 12.8 MHz (lowest frequency generated in the transmitter) to 4.7 GHz. Any emissions that were between the required attenuation and the noise floor of the spectrum analyzer were recorded. Data are shown in Table 1.

TABLE 1

TRANSMITTER CONDUCTED SPURIOUS
462.5625 MHz, 7.2 Vdc, 2.0 W

<u>Spurious Frequency</u> <u>MHz</u>	<u>dB Below</u> <u>Carrier Reference</u>
925.125	73
1387.688	>100
1850.250	99
2312.813	>100
2775.375	>100
3237.938	>100
3700.500	99
4163.063	>100
4625.625	>100
Required: $43+10\log(P)$	46

All other emissions from 12.8 MHz to 4.7 GHz were 20 dB or more below FCC limit.

F. DESCRIPTION OF MEASUREMENT FACILITIES

A description of the Hyak Laboratories' radiation test facility is a matter of record with the FCC. The facility was approved for radiation measurements from 25 to 1000 MHz on October 1, 1976 and is currently listed as an acceptable site.

G. FIELD STRENGTH MEASUREMENTS OF SPURIOUS RADIATION

Field intensity measurements of radiated spurious emissions from the GR-823 were made with a Tektronix 494P spectrum analyzer using Singer DM-105A calibrated test antennae for the measurements to 1 GHz, and EMCO 3115 horn above 1 GHz. The transmitter and dummy load were located in an open field 3 meters from the test antenna. Supply voltage was a power supply with a terminal voltage under load of 7.2 Vdc. Output power was 2.0 watts at the 462.5625 MHz operating frequency. The transmitter and test antennae were arranged to maximize pickup. Both vertical and horizontal test antenna polarization were employed.

Reference level for the spurious radiations was taken as an ideal dipole excited by 2.0 watts, the output power of the transmitter according to the following relationship:*

$$E = \frac{(49.2P_t)^{1/2}}{R}$$

where E = electric-field intensity in volts/meter

P_t = transmitter power in watts

R = distance in meters

for this case $E = \frac{(49.2 \times 2.0)^{1/2}}{3} = 3.3 \text{ V/m}$

Since the spectrum analyzer is calibrated in decibels above one milliwatt (dBm), a conversion, for convenience, was made from dBu to dBm.

$$3.3 \text{ volts/meter} = 3.3 \times 10^6 \text{ uV/m}$$

$$\begin{aligned} \text{dBu/m} &= 20 \text{ Log}_{10} (3.3 \times 10^6) \\ &= 130 \text{ dBu/m} \end{aligned}$$

Since 1 uV/m = -107 dBm, the reference becomes

$$130 - 107 = 23 \text{ dBm}$$

The measurement system was capable of detecting signals 90 dB or more below the reference level. Measurements were made from the lowest frequency generated within the unit (12.8 MHz), to 10 times operating frequency, 4.7 GHz. Data after application of antenna factors and line loss corrections are shown in Table 2.

Required: $43+10\text{Log}(P)$ = 46

¹Worst-case polarization, H-Horizontal, V-Vertical.

*Reference data only, more than 20 dB below FCC limit.

All other spurious from 12.8 MHz to 4.7 GHz were 20 dB or more below FCC limit.

H. FREQUENCY STABILITY
(Paragraph 2.995(a)(2) and 95.621(b) of the Rules)

Measurement of frequency stability versus temperature was made at temperatures from -30°C to $+50^{\circ}\text{C}$. At each temperature, the unit was exposed to test chamber ambient a minimum of 60 minutes after indicated chamber temperature ambient had stabilized to within $\pm 2^{\circ}$ of the desired test temperature. Following the 1 hour soak at each temperature, the unit was turned on, keyed and frequency measured within 2 minutes. Test temperature was sequenced in the order shown in Table 3, starting with -30°C .

A Thermotron S1.2 temperature chamber was used. Temperature was monitored with a Keithley 871 digital temperature probe. The transmitter output stage was terminated in a dummy load. Primary supply was 7.2 volts. Frequency was measured with a HP 5385A digital frequency counter connected to the transmitter through a power attenuator. Measurements were made at 462.5625 MHz. No transient keying effects were observed.

TABLE 3

462.5625 MHz, 7.2 V Nominal, 2.0 watts

<u>Temperature, $^{\circ}\text{C}$</u>	<u>Output Frequency, MHz</u>	<u>p.p.m.</u>
-29.0	462.560632	-4.0
-20.1	462.560807	-3.7
- 9.7	462.561274	-2.7
- 0.1	462.561809	-1.5
10.4	462.562258	-0.5
10.4	462.562558	0.1
20.0	462.562636	0.3
30.2	462.562539	0.1
49.9	462.562272	0.5

Maximum frequency error: 462.560632
462.562500

- .001868 MHz

FCC Rule 95.621(b) specifies .0005% or a maximum of $\pm$.002313 MHz, which corresponds to:

High Limit	462.564813 MHz
Low Limit	462.560187 MHz

I. FREQUENCY STABILITY AS A FUNCTION OF SUPPLY VOLTAGE
(Paragraph 2.995(d)(2) of the Rules)

Oscillator frequency as a function of power supply voltage was measured with a HP 5385A digital frequency counter as supply voltage provided by an HP 6264B variable dc power supply was varied from $\pm 15\%$ above the nominal 7.2 volt rating to below the battery end point. A Keithley 197 digital voltmeter was used to measure supply voltage at transmitter primary input terminals. Measurements were made at 20 °C ambient.

TABLE 4

462.5625 MHz, 20°C, 7.2 V Nominal, 2.0 watts

<u>%</u>	<u>Supply Voltage</u>	<u>Output Frequency, MHz</u>	<u>p.p.m.</u>
