ELECTROMAGNETIC EMISSIONS TEST REPORT

ACCORDING TO FCC CFR 47 PART 15 SUBPART B, PART 90 SUBPART I
for

Miltel Communications Ltd.

EQUIPMENT UNDER TEST:

Transmitter for meter reading system and data collection
Models: Galaxy Remote, SpeedRead, Irriwise

This report is in conformity with ISO/IEC 17025. The A2LA logo endorsement applies only to the test methods and the standards that are listed in the scope of Hermon Laboratories accreditation.
The test results relate only to the items tested. **This test report must not be reproduced in any form except in full with the approval of Hermon Laboratories Ltd.**

1 Project information

Description of equipment under test

Test items	: Transmitter for meter reading system and data collection
Manufacturer	: Miltel Communications Ltd.
Types (Models)	: 1) Galaxy Remote 2) SpeedRead 3) Irriwise

Applicant information

Applicant's responsible person	: Mr. Erez Sharabi, V.P. engineering
Company	: Miltel Communications Ltd.
Address	: 7 Leshem street
P.O.Box	: 7374
City	: Petach Tikva
Postal code	: 49170
Country	: Israel
Telephone number	: +972 3926 9550
Telefax number	: +972 3924 6550

Test performance

Project Number:	: 15703
Location	: Hermon Laboratories
Receipt date	: October 08, 2003
Test started	: October 09, 2003
Test completed	: December 25, 2003
Purpose of test	: Apparatus compliance verification in accordance with emission requirements
Test specification(s)	: 47CFR part 90, §§90.217(b), part 15 §15.109

2 Summary and signatures

The EUT, transmitter of automatic meter reading system, was tested according to FCC part 90 subpart I §90.217(b), part 15 §15.109 and found to comply with the standard requirements.

Test description	Specification reference	Tested by	Date tested	Test report paragraph	Verdict
RF output power	90.217, 2.1046	Mr. Y. Neuman, test engineer	December 25, 2003	4.1	Tested
Occupied bandwidth	90.209, 2.1049	Mr. Y. Neuman, test engineer	December 25, 2003	4.2	Tested
Transient frequency behavior	90.214	Mr. Y. Neuman, test engineer	December 11, 2003	4.3	Tested
Emission mask	90.217(b)	Mr. Y. Neuman, test engineer	December 25, 2003	4.4	Pass
Radiated spurious emissions	90.210, 2.1053	Mr. I. Fershtater, test engineer	December 9, 2003	4.5	Pass
Radiated emissions	15.109	Mr. I. Fershtater, test engineer	December 2, 2003	4.6	Pass
Frequency stability	90.213, 2.1055	Mr. I. Fershtater, test engineer	December 9, 2003	4.7	Tested

Test report prepared by:

Mr. Yuri Neuman, MSCEE, test engineer

Test report approved by:

Mr. Michael Nikishin, MSCEE, group leader

Mr. Edward Usoskin, PhD, C.E.O.

3 EUT description

3.1 General description

The EUT is a transmitter of automatic meter reading system, operating in 450-470 MHz frequency band with FSK modulation and utilizing an integral antenna (models Galaxy Remote and SpeedRead) or external antenna with SMA connector (model Irriwise). Data bit rate is 600 bps. The device is powered by 3.6 V internal battery. The frequencies generated or used in the EUT are: 20 MHz, 4 MHz.

SpeedRead general view

Irriwise general view

4 Test results

4.1 Peak output power

4.1.1 General

This test was performed to measure maximum peak output power, which must not exceed 120 mW.

4.1.2 Test procedure

Radiated test

- 4.1.2.1** The EUT was set up on a wooden 80 cm height turntable at the OATS as shown in Figure 4.1.1, energized and its proper operation was checked.
- 4.1.2.2** The measurements were performed at 3 m test distance with log periodic antenna. To find maximum radiation the turntable was rotated 360°, measuring antenna height was changed from 1 to 4 m, and the antennas polarization was changed from vertical to horizontal.
- 4.1.2.3** The EUT was replaced with a substitution dipole antenna connected to a signal generator.
- 4.1.2.4** The measuring antenna height was changed from 1 to 4 m to find a maximum radiation. The level of the signal generator output was adjusted until the previously recorded field strength maximum reading was obtained as depicted in Table 4.1.1 (a).
- 4.1.2.5** The equivalent power was calculated using the equation:

$$\text{ERP (dBm)} = P_{\text{out gen}} \text{ (dBm)} - \text{cable loss (dB)} + G_a \text{ (dBd)}, \text{ where}$$

$P_{\text{out gen}}$ is the generator output power

G_a is the gain of the substitution antenna used relative to an ideal half-wave dipole antenna.

Conducted test

- 4.1.2.6** The EUT was connected to the spectrum analyzer through the RF cable with 0.3 dB loss and 30 dB attenuator and the radio transmission was activated. RF output power was measured at 3 carrier frequencies (low, middle, high) 450 MHz, 460 MHz and 470 MHz. The measured result was corrected for external attenuator and cable loss, for test results refer to Table 4.1.1 (b).

The transmitter, models Galaxy Remote, Speedread and Irriwise, has output power not exceeding 120 mW and, therefore, is exempt from the technical requirements of subpart I, but must instead comply with provisions of the §90.217(b).

Setup for radiated emissions test

4.2 Occupied bandwidth

4.2.1 General

This test was performed to measure occupied bandwidth by conductive method.

4.2.2 Test procedure

4.2.2.1 The EUT was connected to the spectrum analyzer, which settings are shown in plots, through the RF cable with 0.3 dB loss and 30 dB attenuator and the radio transmission was activated.

4.2.2.2 The measurements were performed at carrier frequency in continuous transmit mode of operation at frequency band between 23 dBc points.

4.2.2.3 The test results are shown in Table 4.2.1.

TEST EQUIPMENT USED:

	Alternate	12.83	A9

4.3 Transient frequency behavior

4.3.1 General

This test was performed to measure carrier frequency drift as function of time during transmitter start up and shut down. Specification test limits are given in Table 4.3.1. The test results are provided in the associated plots.

Table 4.3.1

Transient frequency limits

REFERENCE STANDARD: ANSI/TIA-603A

Carrier frequency tolerance, kHz	Duration, ms	Time interval*
± 12.5	10.0 ms	t_1
± 6.25	25.0 ms	t_2
± 12.5	10.0 ms	t_3

* - t_{on} is the instant when a 1 kHz test signal is completely suppressed;

t_1 is the time period immediately following t_{on} ;

t_2 is the time period immediately following t_1 ;

t_3 is the time period from the instant when the transmitter is turned off until t_{off} ;

t_{off} is the instant when the 1 kHz test signal starts to rise.

4.3.2 Test procedure

4.3.2.1 The EUT was set up as shown in Figure 4.3.1, energized and its proper operation was checked. Variable attenuator was adjusted to provide signal level approximately 40 dB below the FM receiver maximum allowed level as measured with RF power meter. The EUT was turned off.

4.3.2.2 The signal generator was set to the assigned transmitter frequency modulated with 1 kHz tone at 25 kHz deviation and the output power was adjusted to provide the same as the EUT signal level at the FM receiver input as measured with power meter.

4.3.2.3 The storage oscilloscope was set to provide horizontal sweep rate 10 milliseconds per division. Amplitude control of the storage oscilloscope was adjusted to obtain 1 kHz sinusoidal signal vertically centered with ± 4 divisions amplitude.

4.3.2.4 The variable attenuator was adjusted to increase RF level supplied to splitter by 30 dB and the EUT was consequently turned on and off. Transient frequency during power switching was captured and shown in the associated plots.

RELATIVE HUMIDITY: 47%
AMBIENT TEMPERATURE: 23°C
AIR PRESSURE: 1021 hPa
OPERATING FREQUENCY RANGE: 450-470 MHz
MODULATION: Unmodulated

Conducted test – for Irriwise model only

Carrier frequency, MHz	Frequency tolerance, kHz	Time interval	Duration, ms	Refer to plot in Appendix A
450	±12.5*	t ₁	0.2	A10
	±6.25	t ₂	NA	A10
	±12.5*	t ₃	<0.2	A11
460	±12.5*	t ₁	0.2	A12
	±6.25	t ₂	NA	A12
	±12.5*	t ₃	<0.2	A13
470	±12.5*	t ₁	0.12	A14
	±6.25	t ₂	NA	A14
	±12.5*	t ₃	<0.2	A15

*Note: the frequency difference during this time period may exceed the maximum frequency difference for this time period because the transmitter carrier output power rating is less than 6 watts

4.4 Emission mask test according to part 90 §90.217(b)

4.4.1 General

This test was performed to measure emission mask and spurious emissions at RF antenna connector. For equipment designed to operate with a 12.5 kHz channel bandwidth, the sum of the bandwidth occupied by the emitted signal plus the bandwidth required for frequency stability shall be adjusted so that any emission appearing on a frequency 25 kHz or more removed from the assigned frequency is attenuated at least 30 dB below the unmodulated carrier.

The test results are provided in Table 4.4.1, Table 4.4.2 and plots A16-A51.

4.4.2 Test procedure

4.4.2.1 The EUT was set up as shown in Figure 4.4.1, energized and its proper operation was checked.

4.4.2.2 The alternate ("0" and "1") modulation was applied to provide the worst case of RF spectrum mask. The spectrum analyzer's resolution bandwidth was set to a value greater than 5% of the bandwidth requirements. The spectrum analyzer was put in "Maximum hold" mode and the measurements were made under normal test conditions. The frequencies of the lower (f_1) and upper (f_2) points, where the displayed power envelope of modulation equals the spurious emission level (see paragraph 4.1) are provided in Table 4.4.1. and plots A16-A21. The frequencies f_{LOW} and f_{HIGH} were calculated upon the formulas: $f_{LOW} = f_1 - \text{maximum negative frequency deviation}$; $f_{HIGH} = f_2 + \text{maximum positive frequency deviation}$ and found within 25 kHz removed from the assigned frequency.

4.4.2.3 The "all 0" modulation was applied to provide the worst case of spurious emission. The test was performed with spectrum analyzer as provided in Table 4.4.2 and plots A22-A51.

4.5 Radiated spurious emission measurements

4.5.1 General

This test was performed to measure radiated spurious emissions from the EUT. Specification test limits are given in Table 4.5.1.

Table 4.5.1

Radiated spurious emission test limits

REFERENCE STANDARD:

47CFR, part 90, §90.217(b)

Frequency, MHz	Model	Carrier frequency, MHz	Attenuation below the unmodulated carrier, dBc	ERP of spurious (see paragraph 4.1), dBm	Equivalent field strength limit @ 3m, dB(μV/m)
0.009 – 10 th harmonic	Galaxy Remote	450	30	-17.1	80.3
		460	30	-16.6	80.8
		470	30	-17.5	79.9
	SpeedRead	450	30	-16.6	80.8
		460	30	-16.4	81.0
		470	30	-17	80.4
	Irriwise	450	30	-15.3	82.1
		460	30	-15.7	81.7
		470	30	-15.8	81.6

NOTE 1: Radiated spurious emission limits do not apply to emissions within ± 50 kHz from the edge of the authorized bandwidth.

NOTE 2: Equivalent field strength limit was calculated from maximum allowed ERP of spurious as follows:
 $E = \sqrt{30 \times \text{ERP} \times 1.64} / r$, where P is ERP in Watts, 1.64 is numeric gain of ideal dipole and r is antenna to EUT distance in meters (3 m).

4.5.2 Test procedure for spurious emission field strength measurements in 9 kHz to 30 MHz band

4.5.2.1 The EUT was set up as shown in Figure 4.5.1, energized and the performance check was conducted.

4.5.2.2 The specified frequency range was investigated with antenna connected to spectrum analyzer/ EMI receiver. To find maximum radiation the turntable was rotated 360° and the measuring antenna was rotated around its vertical axis.

4.5.2.3 The worst test results (the lowest margins) were recorded in Table 4.5.2 and shown in the associated plots.

4.5.3 Test procedure for spurious emission field strength measurements above 30 MHz

4.5.3.1 The EUT was set up as shown in Figure 4.5.2, energized and the performance check was conducted.

4.5.3.2 The specified frequency range was investigated with antenna connected to spectrum analyzer/ EMI receiver. To find maximum radiation the turntable was rotated 360°, the measuring antenna height was changed from 1 to 4 m, its polarization was switched from vertical to horizontal.

4.5.3.3 The worst test results (the lowest margins) were recorded in Table 4.5.2 and shown in the associated plots.

Figure 4.5.1

Setup for spurious emission field strength measurements in 9 kHz to 30 MHz band

Figure 4.5.2

Setup for spurious emission field strength measurements above 30 MHz

4.5.4 Test procedure for substitution ERP measurements of spurious

4.5.4.1 The test equipment was set up as shown in Figure 4.5.3 and energized.

4.5.4.2 RF signal generator was set to the frequency of investigated spurious emission and the RF output level was preliminary adjusted to produce the same field strength as was measured from EUT.

4.5.4.3 The test antenna height was swept to find maximum emission from substitution antenna and RF signal generator output was fine adjusted to produce the same field strength as was measured from EUT.

4.5.4.4 The above procedure was repeated at the rest of investigated frequencies.

4.5.4.5 The worst test results (the lowest margins) were recorded in Table 4.5.3 and shown in the associated plots.

4.6 Unintentional radiated emissions test according to §15.109

METHOD OF MEASUREMENT: ANSI 63.4 §11.6 / ANSI 63.4 §12.1.4
TEST PERFORMED AT: Anechoic chamber
DATE of TEST: December 2, 2003
AMBIENT TEMPERATURE: 22°C
RELATIVE HUMIDITY: 57 %
AIR PRESSURE: 1018 hPa
DISTANCE BETWEEN ANTENNA AND EUT: 3 m
THE EUT WAS TESTED AS: Table-top
FREQUENCY RANGE: 30 MHz – 1 GHz
DETECTOR TYPE: Peak
MEASUREMENT UNCERTAINTY: ± 6 dB max

For test procedure and setup refer to section 4.5.3.

For full test results refer to plots A115 – A117. No radiated emissions from EUT were found.

LIMIT (§ 15.109)

Frequency, MHz	Class B equipment @ 3 m dB(mV/m)
30 - 88	40.0
88 - 216	43.5
216 - 960	46.0
960 - 5000	54.0

TEST EQUIPMENT USED:

HL 0465	HL 0521	HL 0589	HL 0592	HL 0593	HL 0594	HL 0604
HL 1004	HL 2009					

4.7 Frequency stability test

4.7.1 General

This test was performed to measure frequency stability of transmitter RF carrier. The test results are provided in Table 4.7.1.

4.7.2 Test procedure

4.7.2.1 The EUT was setup as shown in Figure 4.7.1, energized and its proper operation was checked.

4.7.2.2 Frequency displacement was measured with spectrum analyzer as a difference between carrier frequency under normal and extreme power supply and ambient temperature conditions.

Table 4.7.1

Frequency stability test results

DATE of TEST:	December 4 and 9, 2003
AMBIENT TEMPERATURE:	22°C
RELATIVE HUMIDITY:	37 %
AIR PRESSURE:	1019 hPa
REFERENCE STANDARD:	47CFR part 90, section 90.213
OPERATING FREQUENCY RANGE:	450-470 MHz
RESOLUTION BANDWIDTH:	300 Hz
VIDEO BANDWIDTH:	1 kHz
MODULATION:	Unmodulated
NOMINAL POWER SUPPLY VOLTAGE:	3.6 V

Conducted test – for model “Irriwise” only

Appendix C Antenna factors and cable loss

Antenna factor
Active Loop Antenna
Model 6502
S/N 2857

Frequency, MHz	Magnetic antenna factor, dB	Electric antenna factor, dB
0.009	-32.8	18.7
0.010	-33.8	17.7
0.020	-38.3	13.2
0.050	-41.1	10.4
0.075	-41.3	10.2
0.100	-41.6	9.9
0.150	-41.7	9.8
0.250	-41.6	9.9
0.500	-41.8	9.8
0.750	-41.9	9.7
1.000	-41.4	10.1
2.000	-41.5	10.0
3.000	-41.4	10.2
4.000	-41.4	10.1
5.000	-41.5	10.1
10.000	-41.9	9.6
15.000	-41.9	9.6
20.000	-42.2	9.3
25.000	-42.8	8.7
30.000	-44.0	7.5

Antenna factor in dB(1/m) is to be added to receiver meter reading in dB(μ V) to convert it into field intensity in dB(μ V/m).

**Antenna factor
Biconical antenna
Electro-Metrics, model BIA-25/30
Ser.No.3566, HL 0566**

Frequency MHz	Antenna Factor dB(1/m)	Frequency MHz	Antenna Factor dB(1/m)
30	14.7	120	16.8
35	12.9	125	15.5
40	12.6	130	15.5
45	12.8	135	15.1
50	12.6	140	14.8

Appendix D General information

Test facility description

Tests were performed at Hermon Laboratories Ltd., which is a fully independent, private, EMC, safety, environmental and telecommunication testing facility. Hermon Laboratories is listed by the Federal Communications Commission (USA) for all parts of Code of Federal Regulations 47 (CFR 47) and by Industry Canada for electromagnetic emissions (file numbers IC 2186-1 for OATS and IC 2186-2 for anechoic chamber), certified by VCCI, Japan (the registration numbers are R-808 for OATS, R-1082 for anechoic chamber, C-845 for conducted emissions site), assessed by TNO Certification EP&S (Netherlands) for a number of EMC, telecommunications, environmental, safety standards, and by AMTAC (UK) for safety of medical devices. The laboratory is accredited by American Association for Laboratory Accreditation (USA) according to ISO/IEC 17025 for electromagnetic compatibility, product safety, telecommunications testing and environmental simulation (for exact scope please refer to Certificate No. 839.01) and approved by Israel Ministry of environmental protection, radiation hazards department (Permit number 1158).

Address: PO Box 23, Binyamina 30500, Israel.

Telephone: +972 4628 8001

Fax: +972 4628 8277

e-mail: mail@hermonlabs.com

website: www.hermonlabs.com

Person for contact: Mr. Alex Usoskin, QA manager.

Abbreviations and acronyms

The following abbreviations and acronyms are applicable to this test report:

ASK	amplitude shift keying
cm	centimeter
dB	decibel
dBm	decibel referred to one milliwatt
dB(μ V)	decibel referred to one microvolt
dB(μ V/m)	decibel referred to one microvolt per meter
EMC	electromagnetic compatibility
EUT	equipment under test
GHz	gigahertz
H	height
Hz	hertz
kHz	kilohertz
kV	kilovolt
L	length
LNA	low noise amplifier
LMS	location and monitoring service
m	meter
MHz	megahertz
NA	not applicable
QP	quasi-peak
RF	radio frequency
rms	root mean square
s	second
V	volt
W	width
