

ELECTROMAGNETIC EMISSIONS TEST REPORT

ACCORDING TO FCC CFR 47 PART 15 SUBPART B, PART 90 SUBPART I
for

Mitel Communications Ltd.

EQUIPMENT UNDER TEST:

**Transmitter of automatic meter reading system,
model MLLSpeed HPRx450**

Description of equipment under test

Test items	Transmitter of automatic meter reading system
Manufacturer	Miltel Communications Ltd.
Types (Models)	MLLSpeed HPRx450
Receipt date	August 18, 2002

Applicant information

Applicant's representative	Mr. Erez Sharabi, V.P. engineering
Applicant's responsible person	Mr. Yarum Locker, C.E.O.
Company	Miltel Communications Ltd.
Address	7 Leshem street
P.O.Box	7374
Postal code	49170
City	Petach Tikva
Country	Israel
Telephone number	+972 3926 9550
Telefax number	+972 3924 6550

Test performance

Test started	August 18, 2002
Test completed	October 20, 2002
Test specification(s)	FCC part 90 subpart I, §§90.205, 90.209, 90.210, 90.213; 90.214; part 15 subpart B §15.109; subpart C §15.207
Test Location:	Hermon Laboratories Ltd. Certified Test Facilities

1 Summary and signatures

The EUT, MLLSpeed HPRx450 transmitter of automatic meter reading system, was tested according to FCC part 90 subpart I, §§90.205, 90.209, 90.210, 90.213, 90.214; part 15 subpart B §15.109, subpart C §15.207 and found to comply with the §90.213 of the standard requirements.

Test description	Specification reference	Test report paragraph	Pass / Fail
RF output power	90.205, 2.1046	3.1	Pass
Occupied bandwidth	90.209 2.1049	3.2	Pass
Emission mask	90.210(d)	3.3	Pass
Conducted spurious emissions	90.210(d) 2.1051	3.3	Pass
Radiated spurious emissions	90.210(d) 2.1053	3.3	Pass
Frequency stability vs temperature	90.213 2.1055	3.4	Pass
Frequency stability vs voltage	2.1055	3.5	Pass
Transient frequency behavior	90.214	3.6	Pass
Conducted emissions	15.207	3.7	Pass
Radiated emissions	15.109	3.8	Pass

2 General information

2.1 Abbreviations and acronyms

The following abbreviations and acronyms are applicable to this test report:

cm	centimeter
dB	decibel
dBm	decibel referred to one milliwatt
dB(μ V)	decibel referred to one microvolt
dB(μ V/m)	decibel referred to one microvolt per meter
DC	direct current
EMC	electromagnetic compatibility
EUT	equipment under test
GHz	gigahertz
H	height
Hz	hertz
kHz	kilohertz
kV	kilovolt
L	length
m	meter
MHz	megahertz
mW	milliwatt
NA	not applicable
PC	personal computer
QP	quasi-peak (detector)
RE	radiated emission
rms	root-mean-square
sec	second
V	volt
W	watt

2.2 Specification references

CFR 47 part 15: 10/2002	Radio Frequency Devices
CFR 47 part 90: 10/2001	Private land mobile radio services, Subpart I

ANSI C63.4:1992	American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz.

2.3 EUT description

The EUT, MLLSpeed HPRx,450 is a data link transceiver operating in 450 – 470 MHz. The channel separation is 12.5 kHz, fast frequency shift key (FFSK) type of modulation is used. The device utilizes the same antenna connector for transmitter and receiver and is powered by 120 V AC/12 V DC adapter.

The EUT operating frequencies generated by clocks are 3.5795 MHz, 4.0 MHz, 10.245 MHz, 13.2256 MHz, 20.0 MHz, by local oscillator – 458.9 MHz.

2.4 EUT test configuration

The EUT ports and lines description is given in Table 2.4.1, test configuration is shown in Figure 2.4.1.

Table 2.4.1 EUT ports and lines

Port type	Port description	Connector type	Quantity	Cable type description	Cable length, m	Connected to
Power	DC power	D-type, 9 pin	1	Unshielded	1	Adapter
Control	Frequency change	As above		Unshielded	0.2	Push-button
Signal	RF	UHF	2	Coax 50 Ω	NA	Termination

Figure 2.4.1 EUT test configuration

3 Emissions measurements

3.1 Effective radiated power measurements according to FCC part 90 paragraph 205(g)

3.1.1 General

This test was performed to determine maximal effective radiated power. The standard maximum allowable ERP is 2 W (33 dBm).

3.1.2 Test procedure

The EUT was connected to the spectrum analyzer through the 40 dB attenuator and the radio transmission was activated.

The three Plots 3.1.1 to 3.1.3 show the maximum RF output power measured at 3 carrier frequencies (low, middle, high) 450.47 MHz, 460.00 MHz and 469.57 MHz with the 40 dB external to the spectrum analyzer attenuation, therefore 40 dB should be added to the plotted results.

The Table 3.1.1 below gives output power in dBm.

Table 3.1.1
Transmitter output RF power test results

Frequency, MHz	Measured result, dBm	Peak output power, dBm	Limit, dBm	Margin, dB	Result
450.47	-24.17	15.83	33	17.17	Pass
460.00	-23.83	16.17	33	16.83	Pass
469.57	-23.67	16.33	33	16.67	Pass

at 460.0 MHz

Plot 3.1.3 RF output power measurement test results
at 469.6 MHz

3.2 Occupied bandwidth measurements according to FCC part 90 paragraph 209

3.2.1 General

According to paragraph 90.209 (5) the maximum authorized bandwidth shall be 11.25 kHz in the 450 – 470 MHz frequency band.

3.2.2 Test procedure

The measurements were performed using spectrum analyzer.

The occupied bandwidth was measured as a frequency band between points where power envelope of carrier, modulated with normal signal, drops 23 dB below unmodulated carrier.

Measured occupied bandwidth was 10.2 kHz for high channel frequency.

The test results are recorded in Table 3.2.1 and shown in Plots 3.2.1 to 3.2.3.

3.3 Emission mask according to FCC part 90 paragraph 210(d)

3.3.1 General

The power of any emission must be attenuated below the transmitter unmodulated carrier output power (P in watts) as follows:

- 1) On any frequency from the center of the authorized bandwidth f_0 to 5.625 kHz removed from f_0 Zero dB;
- 2) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 5.625 kHz, but not more than 12.5 kHz:
at least $7.27 (f_d - 2.88 \text{ kHz})$ dB;
- 3) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 12.5 kHz: at least $50 + 10 \log (P)$ dB or 70 dB, whichever is the lesser attenuation.

3.3.2 Test procedure

The **emission mask** calculated according to formulas (1) – (3) and measured results are shown in Plots 3.3.1 to 3.3.3.

Conducted spurious emissions were measured at the EUT output terminals in the frequency range from 9 kHz up to 5 GHz, test results are shown in Plots 3.3.4 to 3.3.36. The specified limit $50 + 10 \log (P)$ was converted in EIRP units – 20 dBm and applied spurious emissions throughout the following frequency ranges:

9 kHz to 450.35 MHz and 450.45 MHz to 5 GHz,

9 kHz to 459.95 MHz and 460.05 MHz to 5 GHz,

9 kHz to 469.55 MHz and 469.65 MHz to 5 GHz - according to paragraph 2.1057(a)(1).

Radiated spurious emissions were measured in the anechoic chamber at 3-m test distance: with the loop antenna in the range 9 kHz to 30 MHz,
the biconilcal - in the range 30 MHz to 200 MHz,
the log periodic - in the range 200 MHz to 1000 MHz,
the double ridged guide – in frequency range from 1000 to 5000 MHz.

The EUT was set up on the 80 cm height wooden table, as shown in Figures 3.3.1, 3.3.2 and Photographs 3.3.1 to 3.3.3.

To find maximum radiation the turntable was rotated 360° , the biconical, log periodic, double ridged guide measuring antennas height varied from 1 to 4 m and the antennas polarization was changed from vertical to horizontal.

The test results were shown in Plots 3.3.37 to 3.3.54.

To find spurious emissions attenuation below the unmodulated carrier the substitution method was used. The EUT was replaced with a substitution antenna connected to signal generator. The measuring antenna height was changed from 1 to 4 m to find a maximum radiation. The level of the signal generator output was adjusted until the previously recorded field strength maximum reading was obtained as depicted in Tables 3.3.1 to 3.3.3.

The maximum transmitter output power is 0.042 W (16.33 dBm), and attenuation shall be

$$50 + 10 \log 0.04 = 36.17 \text{ dB}$$

The dipole equivalent power was calculated using the equation:

$$P_d \text{ (dBm)} = P_{\text{out gen}} \text{ (dBm)} - \text{cable loss (dB)} + G_a \text{ (dBd)}, \text{ where}$$

P_d is the dipole equivalent power

$P_{\text{out gen}}$ is the generator output power

G_a is the gain of the substitution antenna used relative to an ideal half-wave dipole antenna.

The attenuation below the unmodulated carrier power is calculated according to the formula:

$$\text{Attenuation (dB)} = 10 \log \{P \text{ [mW]}\} \text{ (dBm)} - P_d \text{ (dBm)}$$

The test results are recorded in Tables 3.3.1 to 3.3.3. The EUT was found to comply with standard requirements.

3.4 Frequency stability measurements according to FCC part 90 paragraph 213

3.4.1 General

According to paragraph 90.213, the frequency stability limit (in parts per million) for equipment with a 12.5 kHz channel bandwidth in frequency range 450 – 470 MHz is 2.5 ppm.

For frequency 450 400 140 Hz the specified limit is ± 1126 Hz

460 000 140 Hz - ± 1150 Hz

469 600 150 Hz - ± 1174 Hz.

3.4.2 Test procedure

The EUT frequency stability was investigated for various temperatures in the range from -30°C to $+50^{\circ}\text{C}$ at the low, middle and high frequency channels.

Test results were recorded in Tables 3.4.1 to 3.4.6. The maximum measured displacement was 1000 Hz.

The EUT was found to comply with the standard requirements.

3.5 Transient frequency behavior according to FCC part 90 paragraph 214

3.5.1 General

Transmitters designed to operate in 450 – 470 MHz frequency range with 12.5 kHz channels must maintain transient frequencies within the maximum frequency difference limits during the time intervals indicated:

Time interval ^{1,2}	Maximum frequency difference ³
$t_1=10\text{ ms}$ ⁴	12.5 kHz
$t_2=25\text{ ms}$	6.25 kHz
$t_3=10\text{ ms}$ ⁴	12.5 kHz

¹ – t_{on} is the instant when a 1 kHz test signal is completely suppressed, including any capture time due to phasing

t_1 is the time period immediately following t_{on}

t_2 is the time period immediately following t_1

t_3 is the time period from the instant when the transmitter is turned off until t_{off}

t_{off} is the instant when the 1 kHz test signal starts to rise.

² – During the time from the end of t_2 to the beginning of t_3 , the frequency difference must not exceed the limit specified in FCC part 90 §90.213.

³ – Difference between the actual transmitter frequency and the assigned transmitter frequency.

⁴ - The frequency difference during this time period may exceed the maximum frequency difference for this time period because the transmitter carrier output power rating is less than 6 watts.

3.5.2 Test procedure

The EUT was setup as shown in Photograph 3.5.1. The transmitter was activated, the signal trace was observed. The frequency was maintained within allowable limits during $t_1=10\text{ ms}$ and $t_2=25\text{ ms}$, also it remained within limits following t_2 . The test results were recorded in Plots 3.5.1, 3.5.2, 3.5.4 and 3.5.6.

The transmitter was turned off and the frequency behavior was observed. The test results were recorded in Plots 3.5.3, 3.5.5 and 3.5.7.

The EUT was found to comply with the standard requirements.

3.6 Radiated emission measurements according to FCC part 15 subpart B §15.109

3.6.1 General

This test was performed to measure radiated emissions from the receiver and incorporated digital device of the EUT, also to verify the EUT full compliance with §15.109.

Radiated emission measurements specification limits are given in Table 3.6.1 below:

Table 3.6.1
Limits for electric field strength, quasi-peak detector @3 meter distance

Frequency MHz	Class B equipment dB(μV/m)
30 - 88	40
88 - 216	43.5
216 - 960	46
960 - 5000	54

3.6.2 Test procedure

The radiated emissions measurements of the EUT digital part were performed in the anechoic chamber at 3 meter measuring distance in the frequency range from 30 MHz up to 5th harmonic of the receiver local oscillator with the biconilog and double ridged guide antennas.

The EUT in stand-by mode was placed on the wooden table as shown in Figure 3.3.1 and Photographs 3.3.2, 3.3.3. To find maximum radiation the turntable was rotated 360°, the measuring antennas height changed from 1 to 4 m, and the antennas polarization was changed from vertical to horizontal.

The results of measurements were recorded in Table 3.6.2 and shown in Plots 3.6.1 to 3.6.4.

Table 3.6.2 Radiated emission measurements test results

TEST SPECIFICATION: 47CFR part 15, subpart B, class B
DATE: October 16, 2002
RELATIVE HUMIDITY: 43%
AMBIENT TEMPERATURE: 25°C
AIR PRESSURE: 1009 hPa
THE EUT WAS TESTED AS: TABLE-TOP
TEST PERFORMED AT: Anechoic chamber
DISTANCE BETWEEN ANTENNA AND EUT: 3 m
FREQUENCY RANGE: 30 MHz – 2 GHz
DETECTOR TYPE: QUASI-PEAK
RESOLUTION BANDWIDTH: 120 kHz

Frequency, MHz	Ant. pol.	Ant. hgt., m	TT pos., (°)	Radiated emissions, dB (μV/m)	Specification class B limit, dB (μV/m)	Margin, dB	Pass/ Fail
105.905000	H	1.0	140	21.53	43.5	21.97	Pass
119.138750	V	1.0	28	20.05	43.5	23.45	Pass
449.306500	H	1.8	90	42.95	46.0	3.05	Pass
898.602750	H	1.0	90	32.44	46.0	13.56	Pass

The test results recorded in the table were obtained throughout the testing with biconilog antenna and quasi-peak detector with resolution bandwidth = 120 kHz.

Table calculations and abbreviations:

Radiated emission dB(μV/m) = measured results dB(μV) + correction factor dB(1/m).

Ant. pol. = antenna polarization (V-vertical, H-horizontal).

Ant. hgt. = antenna height.

TT pos. = turntable position in degrees, (EUT front panel = 0°).

Margin = dB below (negative if above) specification limit.

3.7 Mains terminal radio interference voltage measurements

3.7.1 General

This test was performed to measure common mode conducted emissions at the power port. Specification test limits are given in Table 3.7.1. The worst test results (the lowest margins) were recorded in Table 3.7.2 and shown in the associated plots.

Table 3.7.1
Mains terminal radio interference voltage specification test limits

Frequency, MHz	Class B equipment, dB(μ V)
0.45 – 30	48.0

3.7.2 Test procedure

The EUT was set up as shown in Figure 3.7.1 and the associated photograph, energized and the performance check was conducted. The measurements were performed at mains terminals by means of the LISN, connected to a spectrum analyzer in the frequency range referred to in Table 3.7.1. Unused coaxial connector of the LISN was terminated with 50 Ω . Quasi-peak detector was used throughout the testing as referred to in Table 3.7.2.

The position of the device cables was varied to determine maximum emission level.

The EUT was found to be in compliance with the standard requirements and passed the test.

0672	Shielded Room 4.6(L) x 4.2(W) x2.4(H) m	Hermon Labs	SR-3	027	11/03 Check
0758	Power supply, 36 V, 1 A	Horizon Electronics	DHR 36-1	5361231	6/03 Check
0783	Tester Leakage 230 V Current Standard IEC 601	HL	MD2-L-601	142	8/03
0787	Transient limiter	Hewlett Packard	11947A-8ZE	3107A01877	11/03
0793	Radio communication test set	Marconi Instruments	2955	9507/179	2/03
0808	Analyzer spectrum, 100 Hz to 2.2 GHz, AM/FM modulator	Anritsu	MS2601B	M178731	3/03
1004	Cable coaxial, PSWJ4, 6 m	ANDREW	ANDREW-6	163	12/03
1116	Antenna horn, 1-18 GHz	Hermon Labs	A1-18	186	3/03
1424	Spectrum analyzer, 30 Hz - 40 GHz	Agilent Technologies	8564EC	3946A00219	8/03

No.	Description	Manufacturer information			Due calibr.
		Name	Model No.	Serial No.	
1425	EMI Receiver System, 9 kHz - 2.9 GHz	Agilent Technologies	8542E	3710A00222	9/03
1430	EMI Receiver System, 9 kHz - 2.9 GHz	Agilent Technologies	8542E	3807A00262	9/03
1501	Cable RF, 6 m	Belden	M17/167 MIL-C-17	NA	12/03
1508	Cable RF, 2 m	Telequis	RG-58 C/U	NA	9/03
1509	Cable RF, 2 m	Telequis	RG-58 C/U	NA	9/03
1511	Cable RF, 8 m	Belden	M17/167 MIL-C-17	NA	9/03 Check
1518	Cable RF, 0.5 m	Telequis	MIL-C-17F-RG 058	NA	12/03
1521	Cable RF, 1.0 m	Telequis	MIL-C-17F-RG 058 CU	NA	9/03
1527	Cable RF, 1.3 m	Telequis	MIL-C-17F-RG 058 CU	NA	12/03
1566	Cable RF, 2 m	Huber-Suhner	Sucoflex 104PE	13094/4PE	12/03
1637	Cable, RG-214, 6 m	Hermon Labs	C214-6	1637	12/03
1650	Attenuators set (2, 3, 5, 20 dB), DC – 18 GHz	M/A –COM	2082		3/03
1651	Attenuators set (2, 3, 5, 20 dB), DC – 18 GHz	M/A –COM	2082		3/03
1826	Antenna mast and turntable position controller	Sh. I. Machines	CRL-4	1	5/03 Check
1849	Antenna mast with polarity control	Sh. I. Mashines	AM-F4	NA	1/04 check
1850	Turntable	Sh. I. Mashines	TT-M-3	NA	1/04 check
1939	Cable 40 GHz, 1.5 m, green	Rhophase Microwave Ltd.	KPS-1503A-1500-KPS	T4664	10/03
1942	Cable 18 GHz, 4 m, blue	Rhophase Microwave Ltd	SPS-1803A-4000-NPS	T4658	10/03
1947	Cable 18 GHz, 6.5 m, blue	Rhophase Microwave Ltd	NPS-1803A-6500-NPS	T4974	10/03
1984	Antenna, double ridged waveguide horn, 1-18 GHz, 300 W, N-type	EMC Test Systems	3115	9911-5964	12/03
2009	Cable RF, 8 m	Alpha Wire	RG-214	NA	12/03
2109	Anechoic chamber 6 (L) x 5.5 (W) x 2.95 (H) m	Hermon Labs	AC-2	NA	12/03 Check
2227	Crystal Detector 0.01-18 GHz	Hewlett Packard	8472A	NA	10/03

APPENDIX B-Test equipment correction factors

Biconilog antenna factor, EMCO, model 3141
Ser.No.1011

Frequency, MHz	Antenna Factor, dB(1/m)	Frequency, MHz	Antenna Factor, dB(1/m)
26	7.8	940	24.0
28	7.8	960	24.1
30	7.8	980	24.5
40	7.2	1000	24.9
60	7.1	1020	25.0
70	8.5	1040	25.2
80	9.4	1060	25.4
90	9.8	1080	25.6
100	9.7	1100	25.7
110	9.3	1120	26.0
120	8.8	1140	26.4
130	8.7	1160	27.0
140	9.2	1180	27.0

840	23.1	1940	30.9
860	23.4	1960	31.2
880	23.8	1980	31.6
900	24.1	2000	32.0
920	24.1		

Antenna factor is to be added to receiver meter reading in dB(μ V) to convert to field intensity in dB(μ V/meter).
