Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 30 days only.

RELEASE HISTORY

Version	Changes	Issued
1.0	Initial release	14 June 2021
1.1	The following sections were updated: • Peripherals • EUT Test Conditions • Unwanted emissions (radiated) results	21 February 2022
1.2	Unwanted Emissions (radiated) result tables corrected	8 March 2022

PRODUCT DESCRIPTION

Equipment Under Test

Trade mark:	Satel
Model:	SATEL-TR489
Type:	SATEL-TA43
Serial no:	2105000001 (radiated tests) 2107000607 (all other tests)
FCC ID:	MRBSATEL-TA43
IC:	2422A-SATELTA43

General Description

The equipment under test is a radio module using 403-473 / 869.4-869.65 / 902-928 MHz bands. This test report contains the results for 900 MHz radio.

Classification

Fixed device	☒
Mobile Device (Human body distance > 20cm)	☒
Portable Device (Human body distance < 20cm)	☐

Modifications Incorporated in the EUT

No modifications.

Ports and cables

Cable / Port	Description
Serial port RS232	Device configuration and data communication. Unshielded
DC input port	3.8 – 5.5 VDC (4.6 V used during testing)
Antenna port	50Ω TNC (female)

Specifications

Operating Frequency Range (OFR):	902-928 MHz
Channels:	110
Channel separation:	230.4 kHz
Transmission technique:	FHSS
Modulation:	GMSK

Mechanical Size of the EUT

Height: 6.7 mm	Width: 36 mm	Length: 57 mm	Weight: 0.02 kg
----------------	--------------	---------------	-----------------

Product Description

Peripherals

Peripheral	Description / Usage
Test PC	Device configuration with programs supplied by customer.
Laptop charger	HP L25296-002. Used during AC power-line conducted emissions test.
AC/DC adapter	Nokia AC10-E. Used during AC power-line conducted emissions test.
Whip Antenna	McGill Microwave Systems, MM-ANT-NM-915-6DBI (6 dBi nominal gain). Reference antenna used during testing, supplied by customer.
Yagi Antenna	CompleTech, CA930Y-TNC (6 dBi nominal gain). Reference antenna used during testing, supplied by customer.

SUMMARY OF TESTING

Test Specification	Description of Test	Result
§15.203	Antenna requirement	PASS
§15.207(a) / RSS-GEN 8.8	AC Power-Line Conducted Emissions	PASS
§15.247(a)(1)(i) / RSS-247 5.1 a)	20 dB Bandwidth	PASS
§15.247(a)(1) / RSS-247 5.1 b)	Carrier Frequency Separation	PASS
§15.247(a)(1)(i) / RSS-247 5.1 c)	Number of Hopping Channels	PASS
§15.247(a)(1)(i) / RSS-247 5.1 c)	Average Time of Occupancy	PASS
§15.247(b)(2) / RSS-247 5.4 a)	Transmitter Output Power	PASS
§15.247(d) / RSS-247 5.5	Unwanted Emissions (radiated)	PASS
§15.247(d) / RSS-247 5.5	Band-Edge Measurement and Unwanted Emissions (conducted)	PASS
RSS-GEN 6.7	99% Occupied Bandwidth	PASS

The decision rule applied for the tests results stated in this test report is according to the requirements of section 1.3 of ANSI C63.10-2013.

EUT Test Conditions

The EUT was in continuous transmit mode during all the tests. The EUT was configured into the wanted channel using software provided by the manufacturer ("TypeApproval_489_UI_V030_04022021.exe"). During the tests the EUT was mounted on an evaluation kit provided by the manufacturer (model M3-TR3 Evaluation kit). During the AC Power-Line Conducted Emissions the EUT was connected to a peripheral AC/DC adapter, and the input voltage was 120 V, 60 Hz. The radiated tests were performed with two different reference antennas provided by the customer.

TEST RESULTS

Antenna Requirement

Standard: FCC Rule §15.203
Tested by: HEM
Date: 21 May 2021

FCC Rule: §15.203

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device.

Specification	Requirement (at least one of the following shall be applied)	Conclusion
§15.203	1. Permanently attached antenna 2. Unique coupling to the intentional radiator 3. Professionally installed radio. The installer shall be responsible for ensuring that the proper antenna is employed so that the limits in this part are not exceeded.	PASS
Note	Option 2 is used	

AC Power-Line Conducted Emissions

Standard: ANSI C63.10-2013
Tested by: HEM
Date: 6 June 2021
Temperature: 23 °C
Humidity: 43 %RH
Barometric pressure: 1012 hPa
Measurement uncertainty: ± 2.9 dB
Test Result: **PASS**

Level of confidence 95 % (k = 2)

FCC Rule: 15.207(a) RSS-GEN 8.8

An intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30 MHz, shall not exceed the limits in §15.207(a) and RSS-GEN 8.8, as measured using a 50 μ H/50 Ω line impedance stabilization network (LISN).

For equipment that connects to the AC power lines indirectly, through another device, the requirement for compliance with the limits shall apply at the terminals of the AC power-line mains cable of a representative support device, while it provides power to the equipment.

Conducted disturbance voltage was measured with an artificial main network from 150 kHz to 30 MHz with 4.5 kHz steps and a resolution bandwidth of 9 kHz. Measurements were carried out with peak and average detectors.

Frequency of emission (MHz)	Conducted limit (dB μ V)	
	Quasi-peak	Average
0.15-0.5	66 to 56*	56 to 46*
0.5-5	56	46
5-30	60	50

*Decreases with the logarithm of the frequency.

During the test the EUT was powered with an AC/DC adapter and was connected to a laptop for configuring the radio. The conducted emissions were measured from both the AC/DC adapter. The radio was set to hopping mode during the test.

Test results

Figure 2: The measured curves with peak- and average detector

Table 2: Final measurements from the worst frequencies

Frequency (MHz)	QuasiPeak (dBµV)	CAverage (dBµV)	Limit (dBµV)	Margin (dB)	Meas. Time (ms)	Bandwidth (kHz)	Line	Corr. (dB)
0.150000	39.86	---	66.00	26.14	15 x 1000.0	9.000	N	9.7
0.210250	33.93	---	63.20	29.27	15 x 1000.0	9.000	N	9.7
2.056250	28.75	---	56.00	27.25	15 x 1000.0	9.000	L1	9.9
2.194750	28.83	---	56.00	27.17	15 x 1000.0	9.000	L1	9.9
2.805250	29.20	---	56.00	26.80	15 x 1000.0	9.000	L1	9.9
3.031750	29.33	---	56.00	26.67	15 x 1000.0	9.000	L1	9.9

The correction factor in the final result table contains the sum of the transducers (cables).

The result value is the measured value corrected with the correction factor.

20 dB Bandwidth

Standard: ANSI C63.10-2013
Tested by: HEM
Date: 24 May 2021
Temperature: 21 °C
Humidity: 28 %RH
Barometric pressure: 1008 hPa
Test Result: **PASS**

FCC Rule: §15.247(a)(1)(i)
RSS-247 5.1 a)

The bandwidth of a frequency hopping channel is the 20 dB emission bandwidth, measured with hopping stopped.

Test results

Table 3: 20 dB Bandwidth test results

Channel	20 dB Bandwidth [kHz]
Bottom	131.824
Middle	131.871
Top	132.090

Figure 3: 20 dB Bandwidth, bottom channel

Figure 4: 20 dB Bandwidth, middle channel

Figure 5: 20 dB Bandwidth, top channel

Carrier Frequency Separation

Standard: ANSI C63.10-2013
Tested by: HEM
Date: 24 May 2021
Temperature: 21 °C
Humidity: 28 %RH
Barometric pressure: 1008 hPa
Test Result: **PASS**

FCC Rule: §15.247(a)(1)
RSS-247 5.1 b)

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater.

Test results

Table 4: Carrier Frequency Separation test results

Channel Separation [kHz]	Limit [kHz]	Result
230.400	132.090	PASS

Figure 6: Carrier Frequency Separation

Number of Hopping Channels

Standard: ANSI C63.10-2013
Tested by: HEM
Date: 24 May 2021
Temperature: 21 °C
Humidity: 28 %RH
Barometric pressure: 1008 hPa
Test Result: **PASS**

FCC Rule: §15.247(a)(1)(i)
RSS-247 5.1 c)

If the 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall use at least 50 hopping frequencies.

Test results

Table 5: Number of Hopping Channels test results

Frequency Range [MHz]	Number of Channels	Total Number of Channels	Result
902.0000 – 907.8912	25	110	PASS
907.8912 – 913.8240	25		
913.8240 – 919.8720	25		
919.8720 – 925.6320	25

Average Time of Occupancy

Standard: ANSI C63.10-2013
Tested by: HEM
Date: 24 May 2021
Temperature: 21 °C
Humidity: 28 %RH
Barometric pressure: 1008 hPa
Test Result: **PASS**

FCC Rule: §15.247(a)(1)(i)
RSS-247 5.1 c)

If the 20 dB bandwidth of the hopping channel is less than 250 kHz, the average time of occupancy on any channel shall not be greater than 0.4 seconds within a 20-second period.

Test results

Table 6: Average Time of Occupancy test results

Channel	Number of Hops	Transmit time per single hop [ms]	Average Time of Occupancy [ms]	Result
Bottom	5	1.663125	8.315625	PASS
Middle	5	1.661250	8.306250	PASS
Top	5	1.662938	8.314690	PASS

Transmitter Output Power

Standard: ANSI C63.10-2013
Tested by: HEM
Date: 21 May 2021
Temperature: 23 °C
Humidity: 37 %RH
Barometric pressure: 990 hPa
Test Result: **PASS**

FCC Rule: §15.247(b)(2)
RSS-247 5.4 a)

For frequency hopping systems operating in the 902-928 MHz band, the maximum peak conducted output power shall not exceed 1.0 W, and the e.i.r.p. shall not exceed 4 W if the hopset uses 50 or more hopping channels.

Test results

Table 7: Transmitter Output Power test results

Channel	Measured [dBm]	Attenuation *) [dB]	Output Power [dBm]	Output Power [W]	Result
Bottom	-0.29	30.01	29.72	0.938	PASS
Middle	-0.46	29.96	29.50	0.891	PASS
Top	-0.63	30.00	29.37	0.865	PASS

*) Attenuation includes the total attenuation of cable and attenuators.

Unwanted Emissions (radiated)

Standard:	ANSI C63.10-2013	
Tested by:	HEM	
Date:	20 February 2022	21 February 2022
Temperature:	24 °C	23 °C
Humidity:	42 %RH	32 %RH
Barometric pressure:	986 hPa	981 hPa
Measurement uncertainty:	± 4.51 dB	Level of confidence 95 % (k = 2)
Test Result:	PASS	

FCC Rule: §15.247(d), §15.205(a), §15.209(a)**RSS-247 3.3, 5.5**

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a).

Exploratory measurements are performed in order to find the orientation that produces the highest emissions. The final measurements are performed with the worst orientation.

The measurements are performed with two types of reference antennas (whip antenna and Yagi antenna). For Yagi antenna only the worst-case results are presented.

FCC Rule: §15.247(d), §15.205(a), §15.209(a)

RSS-247 3.3, 5.5

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. Attenuation below the general limits specified in §15.209(a) is not required.

The band-edge measurement is performed with hopping on and off. The worst results are presented (hopping off).

Test results

Table 12: Band-Edge test results

Band-Edge Attenuation	
Lower Band-Edge	Upper Band-Edge
-38.97	-21.90
Limit: -20 dBc

Occupied Bandwidth

Standard: RSS-GEN
Tested by: HEM
Date: 24 May 2021
Temperature: 21 °C
Humidity: 28 %RH
Barometric pressure: 1008 hPa
Test result: **PASS**

RSS-GEN 6.7

The occupied bandwidth or the “99% emission bandwidth” is defined as the frequency range between two points, one above and the other below the carrier frequency, within which 99% of the total transmitted power of the fundamental transmitted emission is contained.

Test results

Table 13: Occupied Bandwidth test results

Channel	Occupied Bandwidth [kHz]
Bottom	127.168
Middle	125.824
Top	126.309
