Wireless Interoperability

The products are designed to be interoperable with any wireless LAN product that is based on direct sequence spread spectrum (DSSS) and orthogonal frequency division multiplexing (OFDM) radio technology and to comply with the following standards:

- IEEE Std. 802.11b Standard on Wireless LAN
- IEEE Std. 802.11g Standard on Wireless LAN
- Wireless Fidelity (WiFi) certification, as defined by the WECA (Wireless Ethernet Compatibility Alliance)

Wireless 802.11 and Your Health

The Wireless Broadband Router, like other radio devices, emits radio frequency electromagnetic energy. The level of energy emitted by this device, however, is less than the electromagnetic energy emitted by other wireless devices such as mobile phones. The

wireless device operates within the guidelines found in radio frequency safety standards and recommendations. These standards and recommendations reflect the consensus of the scientific community and result from deliberations of panels and committees of scientists who continually review and interpret the extensive research literature. In some situations or environments, the use of the wireless devices may be restricted by the proprietor of the building or responsible representatives of the applicable organization. Examples of such situations include the following:

- Using the Dell TrueMobile equipment on board airplanes, or
- Using the Dell TrueMobile equipment in any other environment where the risk of interference with other devices or services is perceived or identified as being harmful.

If you are uncertain of the policy that applies to the use of wireless devices in a specific organization or environment (an airport, for example), you are encouraged to ask for authorization to use the wireless device before you turn it on.

Technical Specifications

Standards supported

- IEEE 802.3, IEEE 802.3u, IEEE 802.11b, 802.11g

Protocols

- TCP/ IP, IPX, UDP, DHCP Client, DHCP Server

Environment

- Operating Humidity 10% to 85% (Non-Condensing)
- Storage Humidity 5% to 90% (Non-Condensing)
- Operating Temperature 0° to 40° C (32° F to 104° F)
- Storage Temperature 0° to 70° C (32° F to 158° F)

Power specification

Receive Sensitivity

- 11Mbps: 10-5 BER @ -80 dBm, typical

- 54Mbps: 10⁻⁵ BER @ -65 dBm, typical

Transmit Power

- Normal Temp Range: ±12 dBm

DC power supply

- Input: DC 100-250 50-60 Hz 1A
- Output: 5V DC 2A

Radio specification

Range: "Up to 100m" indoors and "Up to 450m" outdoors
(open range)

Frequency range: 2.4 - 2.4835 GHz, direct sequence spread
spectrum

Number of Channels:

- Europe: 11 (1-11)
- US: 11 (1-11)
- France: 2 (10-11)
- Japan: 11 (1-11)

Mobility: Seamless roaming across cell boundaries with
handover

Specific features

Supported bit rates:

For 802.11g:

- 54 Mbps
- 48 Mbps
- 36 Mbps
- 24 Mbps
- 18 Mbps
- 12 Mbps
- 9 Mbps

- 6 Mbps

For 802.11b:

- 11 Mbps
- 5.5 Mbps
- 2 Mbps
- 1 Mbps

Data Encryption: WEP (64/128 bit) and WPA

Utility Software

- Setup Wizard software
- Control Utility software

[Back to Top](#)

Regulatory Information

The wireless network device must be installed and used in strict accordance with the manufacturer's instructions as described in the user documentation that comes with the product. For country-specific approvals, see Radio approvals. Dell Inc is not responsible for any radio or television interference caused by unauthorized modification of the devices included with this kit, or the substitution or attachment of connecting cables and equipment other than that specified by Dell Inc. The correction of interference caused by such unauthorized modification, substitution or attachment is the responsibility of the user. Dell Inc and its authorized resellers or distributors are not liable for any damage or violation of government regulations that may arise from the user failing to comply with these guidelines.

For the latest regulatory information, documentation, and other updates, please visit the Dell website at support.dell.com.

Canada -- Industry Canada (IC)

This device complies with RSS210 of Industry Canada.

[Back to Top](#)

Europe -- EU Declaration of Conformity

This equipment complies with the essential requirements of the European Union directive 1999/5/EC.

Cet équipement est conforme aux principales caractéristiques définies dans la Directive européenne RTTE 1999/5/CE.

Die Geräte erfüllen die grundlegenden Anforderungen der RTTE-Richtlinie 1999/5/EG.

Questa apparecchiatura è conforme ai requisiti essenziali della Direttiva Europea R&TTE 1999/5/CE.

Este equipo cumple los requisitos principales de la Directiva 1999/5/CE de la UE, "Equipos de Terminales de Radio y Telecomunicaciones".

Este equipamento cumpre os requisitos essenciais da Directiva 1999/5/CE do Parlamento Europeu e do Conselho (Directiva RTT).

Deze apparatuur voldoet aan de noodzakelijke vereisten van EU-richtlijn betreffende radioapparatuur en telecommunicatie-eindapparatuur 1999/5/EG.

Dette udstyr opfylder de Væsentlige krav i EU's direktiv 1999/5/EC om Radio- og teleterminaludstyr.

Dette utstyret er i overensstemmelse med hovedkravene i R&TTE-direktivet (1999/5/EC) fra EU.

Utrustningen uppfyller kraven för EU-direktivet 1999/5/EC om ansluten teleutrustning och ömsesidigt erkännande av utrustningens överensstämmelse (R&TTE).

Tämä laite vastaa EU:n radio- ja telepäätelaitedirektiivin (EU R&TTE Directive 1999/5/EC) vaatimuksia.

[Back to Top](#)

France

Some areas of France have a restricted frequency band. The worst-case maximum authorized power indoors is:

10 mW for the entire 2.4 GHz band (2400 MHz - 2483.5 MHz)

100 mW for frequencies between 2446.5 MHz and 2483.5 MHz (NOTE - Channels 10 through 13 inclusive operate in the band 2446.6 MHz - 2483.5 MHz)

There are few possibilities for outdoor use: On private property or on the private property of public persons, use is subject to a preliminary authorization procedure by the Ministry of Defence, with maximum authorized power of 100 mW in the 2446.5 - 2483.5 MHz band. Use outdoors on public property is not permitted.

In the departments listed below, for the entire 2.4 GHz band:

Maximum authorized power indoors is 100 mW

Maximum authorized power outdoors is 10 mW

Departements in which the use of the 2400 - 2483.5 MHz band is permitted with an EIRP of less than 100 mW indoors and less than 10 mW outdoors:

01 Ain	36 Indre	66 Pyrénées
01 Orientales		
02 Aisne	37 Indre et Loire	67 Bas Rhin
03 Allier	41 Loir et Cher	68 Haut Rhin
05 Hautes Alpes	42 Loire	70 Haute Saône
08 Ardennes	45 Loiret	71 Saône et Loire
09 Ariège	50 Manche	75 Paris
11 Aude	55 Meuse	82 Tarn et Garonne
12 Aveyron	58 Nièvre	84 Vaucluse
16 Charente	59 Nord	88 Vosges
24 Dordogne	60 Oise	89 Yonne
25 Doubs	61 Orne	90 Territoire de Belfort
26 Drôme	63 Puy du Dôme	94 Val de Marne
32 Gers	64 Pyrénées Atlantique	

This requirement is likely to change over time, allowing you to use your wireless LAN card in more areas within France. Please check with ART for the latest information

(www.art-telecom.fr)

NOTE: Your Wireless Broadband Router transmits less than 100 mW, but more than 10 mW.

[Back to Top](#)

Italia

A license is required for indoor use. Outdoor use is prohibited.

E' necessaria la concessione ministeriale anche per l'uso interno. Verificare con i rivenditori la procedura da seguire. L'uso per installazione in esterni non e' permessa.

[Back to Top](#)

USA -- Federal Communications Commission (FCC)

Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no

guarantee that interference will not occur in a particular installation. If this equipment does cause

harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

FCC Caution:

To assure continued compliance, any changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate this equipment.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

IMPORTANT NOTE:

FCC Radiation Exposure Statement:

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

NOTE: DELL declares that WRTB-107GD340 (FCC ID: MXF-R921212G) is limited in CH1~CH11 by specified firmware controlled in USA.

[Back to Top](#)

Introduction

[Overview](#)

[Wireless Networking Overview](#)

[A Look at the Hardware](#)

Overview

The Wireless Broadband Router is an 802.11b/g wireless access point with a built-in Internet router. Connecting to a DSL or cable modem, the router can offer both wired and wireless computers simultaneous access to the Internet. The router can be configured the following ways:

- **Internet router:** Connects to a cable or DSL modem providing Internet connectivity to

both wired and wireless computers. The firewall features included in the router control Internet access and protect your network.

- **Wireless hub (Access Point):** Connects wireless computers for file and print sharing.

- **4-port Ethernet switch:** Connects four wired computers for file and print sharing.

- **Ethernet bridge:** Enables file and print sharing between wired and wireless computers. In addition, connects to an Ethernet hub, extending Internet connectivity and sharing to more wired computers.

The router supports up to 252 clients. Up to 16 of the 252 clients can be wireless. The **Network Address Translation (NAT)** feature allows 64 clients to simultaneously communicate out to the Internet. It runs at speeds up to 54 **Megabits per second (Mbps)**, and the LAN (wired) port runs at 10/100 Mbps. The maximum distance between the router and each computer is 300 feet. This distance may be less depending on your environment.

By default, you can use the router in the following ways:

- a wireless access point using **wireless** as the wireless network name.

- a DHCP server that provides IP addresses to wireless and wired clients.
- a bridge to an Ethernet hub.

Wireless Networking Overview

 [Wireless Local Area Network \(WLAN\)](#)

 [Identifying a WLAN](#)

 [Encryption](#)

 [Automatic Rate Selection and Rate Scaling](#)

Wireless Local Area Network (WLAN)

A **Local Area Network** (LAN) is a network in one location. Users at that location can share files, printers, and other services. In a LAN, a networked computer that requests services is called a client. A **Wireless Local Area Network** (WLAN) is a type of LAN that uses high frequency radio waves rather than wires to communicate and transmit data among the network clients and devices. It is a flexible data communication system implemented as an extension to, or as an alternative for, a wired LAN.

In a WLAN, wireless adapters are installed in clients, also called wireless clients. The adapter allows the wireless client to communicate with the WLAN without cables. Instead, wireless clients send and receive information through a path in the air called a channel.

The standards for a WLAN are based on the IEEE 802.11b standard and proposed 802.11g standard. All Dell 802.11b/g-compliant devices interoperate with other 802.11b/g -compliant wireless devices from other vendors. The WiFi certification logo indicates that the wireless device has been tested by an independent organization.

A wireless client operates in either infrastructure mode or peer-to-peer mode.

[Back to Top](#)

Identifying a WLAN

An ESSID and BSSID are both **Service Set Identifiers** (SSID) that identify and control the wireless client's access to a given WLAN. The SSID is sometimes referred to as the network name. The SSID indicates what WLAN you are referring to. In most cases, the user interface displays the SSID.

When installing an access point or wireless adapter in a wireless client, the installation program asks you to enter the SSID. Dell cannot provide you with this information, as it is specific to your network; but you may choose to use the default SSID, **wireless**, for your Router. All wireless clients and access points in a WLAN must use the same network name.

[Back to Top](#)

Encryption

In a WLAN, wireless clients and access points send and receive information through the air. Without implementing security, it is possible for an unauthorized person to intercept the information.

A common way of implementing security and protecting information is encryption. Encryption applies a set of instructions, called an algorithm, to information. The instructions combine the plain or clear text of information with a sequence of hexadecimal numbers, called an encryption key.

Before transmitting information over the airwaves, the wireless client or access point encrypts or scrambles the information. The access point or wireless client receiving the information uses the same key to decrypt or unscramble the information. The information is only readable to WLAN devices that have the correct encryption key. The longer the key is, the stronger the encryption.

The Router supports both **Wired Equivalent Privacy** (WEP) and **Wi-Fi Protected Access** (WPA).

WEP

WEP (Wired Equivalent Privacy) provides a way of creating an encrypted key that is shared between a wireless client (such as a notebook with a wireless PC card) and the router. In the Router, WEP is an optional feature that can be enabled or disabled. When WEP encryption is enabled, you must set the WEP key in the client to match the WEP key used by the access point because you can ONLY connect to access points that have a matching WEP Key.

NOTE: It is better to change keys frequently. The same algorithm is used for all the communications that should be protected. If the same key is used, the same message will give exactly the same cipher text. Then, it will be possible for an eavesdropper to break the encrypted data. For this reason, it is strongly recommended to change keys often.

There are two WEP encryption methods:

- 40(64)-bit Encryption
- 104(128)-bit Encryption

40-bit and 64-bit encryption are identical. Some vendors use the term 40-bit; others use 64-bit. A wireless device that claims to have 40-bit encryption interoperates with a device that claims to have 64-bit encryption; the same is true for the reverse. A 40(64)-bit key consists of 10 hexadecimal numbers, arrayed as follows:

Key #1: 1011121314

Key #2: 2021222324

Key #3: 3031323334

Key #4: 4041424344

A 104(128)-bit key has several trillion times as many possible combinations than a 40(64)-bit key. It consists of 26 hexadecimal numbers, arrayed as follows:

Key (#1): 101112131415161718191A1B1C

All wireless clients and access points in a WLAN must use the same encryption method and key. The following two examples stress how important this point is.

Example 1

The encryption method for an access point is 40(64)-bit. The method for a wireless client is 104(128)-bit encryption. The client and access point cannot communicate with each other, even though the selected key is the same. To resolve this problem, set the access point to use 104(128)-bit encryption.

Example 2

The encryption method is the same for the access point and wireless client. You select key 1 for the access point and key 2 for the wireless client. The wireless client cannot communicate with the WLAN. To resolve this problem, select key 1 for the wireless client.

 **NOTE:** Use the same key and encryption method for the wireless devices in the WLAN. Otherwise, they cannot communicate with each other.

The Router uses either hexadecimal digits or ASCII characters to create encryption keys. Hexadecimal digits include the numbers 0 to 9 and the letters A to F. For example, the decimal number 15 is represented as F in the hexadecimal numbering system.

ASCII is the acronym for the American Standard Code for Information Interchange. Pronounced *ask-ee*, ASCII is a code for representing English characters as numbers, with each letter assigned a number from 0 to 127. For example, the ASCII code for uppercase M is 77. Most computers use ASCII codes to represent text, which makes it possible to transfer data from one computer to another.

WPA

WPA (Wi-Fi Protected Access) is an upgrade to the WEP standard for securing your wireless network. WPA is derived from and will be forward-compatible with the future IEEE 802.11i standard. It provides improved data encryption and user authentication.

To enhance the level of security, WPA uses **Temporal Key Integrity Protocol** (TKIP) encryption to address the vulnerabilities of the static keys used in WEP. TKIP includes four algorithms: **message integrity check** (MIC), to protect packets from tampering; **Per-Packet Key** (PPK) hashing, to prevent weak key attacks; extended **initialization vector** (IV), to reduce IV reuse and the possibility that a hacker will collect sufficient packets to crack the encryption; and a re-keying mechanism, to change the temporal key dynamically. TKIP is the most commonly used encryption method; however, if your wireless clients do not support TKIP, the Router also supports **Advanced Encryption Security** (AES) encryption. AES will replace 802.11's RC4-based encryption under the 802.11i specification. AES, the gold-standard encryption algorithm, provides maximum security for wireless network.

For user authentication, WPA adopts an authentication scheme through 802.1x. 802.1x provides a framework for user authentication and a key distribution management method. 802.1x consists of three main elements: an Authentication Server (typically a RADIUS server), WPA-enabled router or AP (called Authenticator), and a WPA-enabled client (called Supplicant). 802.1x ensures only authorized users can access the network.

In enterprises, WPA will be used in conjunction with both a wireless router and authentication server. In a **Small Office/Home Office** (SOHO) environment, where there is no authentication server, users can use **pre-shared key** (PSK) mode in place of the authentication server. The Router offers you WPA running in PSK mode. The mutual authentication and improved encryption technology of WPA allows wireless communication to achieve greater security.

[Back to Top](#)

Automatic Rate Selection and Rate Scaling

In 802.11g, wireless network adapters and access points can transmit data at one of the following rates: 54, 48, 36, 24, 18, 12, 9, or 6 Mbps. In 802.11b, the data can be transmitted at a rate of 11, 5.5, 2, or 1 Mbps. As the distance between an adapter and access point increases or decreases, the data rate automatically changes. Other factors, like interference, also affect the data rate. The Router uses automatic rate selection and rate scaling to determine the most efficient rate of communication. Rate scaling maintains optimal communication between wireless clients and the WLAN.

[Back to Top](#)

A Look at the Hardware

 [Front Panel](#)

 [Back Panel](#)

Front Panel

The Wireless Broadband Router has seven **Light Emitting Diodes** (LEDs), or link lights, on its front side. The following table defines the behavior for each LED:

Front Panel

LED	Represents	Activity
Power	Power	The Power LED will light up when the device is powered on. It will blink when the device is reset.
Wireless	Wireless LAN	The LED is steady on when there is at least one wireless link connecting to the Router.
Internet	DSL or cable modem	A steady green light indicates the connection is active, and blinks with data activity. A steady amber light indicates data collision.
LAN 1 LAN 2 LAN 3 LAN 4	Local Area Network	A steady green light indicates the connection is active and transfer rate is at 100Mbps. A steady greenish amber light indicates the connection is active and transfer rate is at 10Mbps.

[Back to Top](#)

Back Panel

Back Panel

Connector	Description
Lock	This accepts locking devices for protecting the Router from theft.
Reset	Use an object, such as a stretched paper clip, to press the button for at least 3 seconds. The Power LED will be off for a short time and then light up again. You can then release the button to reset the device to its factory-default settings.
Internet	This accepts an RJ-45 connector for network cabling.
LAN 1 LAN 2 LAN 3 LAN 4	This accepts RJ-45 connectors for connecting up to 4 computers to the Router's 4-port switch.
Power	Connect the power adapter to this Power port, and then plug the other end of the power cable into a power outlet.

[Back to Top](#)

Using Your Router

 [Overview](#)

 [Factory Default Settings](#)

 [Setup Wizard](#)

 [Control Utility](#)

 [Web-Based Configuration Tool](#)

Overview

Factory Default Settings: Your Wireless Broadband Router came with [factory default settings](#) that should work for the majority of the network usage scenarios. However, there are cases where your network environment may require a different router configuration.

Setup Wizard: Setup Wizard is a Windows-based software program included on your CD. You can use this program to 1) install the router on your network and create an environment for multiple computers to share Internet access, 2) add additional computers to the network, and 3) provide links to the user's guide and the [Dell support website](#).

Control Utility: Control Utility is a Windows-based software program included on your CD. This utility is usually installed at the end of the router installation. It provides you with a useful configuration tool to manage your Router. Refer to the section [Control Utility](#) for detailed information.

Web-Based Configuration Tool: The web-based configuration tool is for advanced configuration of the Wireless Broadband Router. It is a tool provided inside the router which can be accessed via the web browser on your computer. This tool includes every basic and advanced configuration option for the Router. For instance, you can allow other Internet users to access a Web server hosted on your local private network, or disable your wireless network.

 **NOTE:** Setup Wizard or Control Utility must be run on Windows 2000 and Windows XP

computers. Microsoft Internet Explorer 4.0 or higher or Netscape 4.0 or higher must be used for the web-based configuration tool.

Factory Default Settings

Dell pre-configures the Router with the following settings:

 **NOTE:** If you lose track of the device settings, you can reset the router by pushing the reset button to restore these settings back to your router.

Setting	Default
User Name	admin
Password	admin
Device Name	my router
IP Address	192.168.2.1
Subnet Mask	255.255.255.0
10 Mbps Ethernet WAN IP	<obtain from ISP via DHCP>
WAN DHCP Client	Enabled
ESSID (wireless network name)	wireless
Channel	6
Encryption	No Encryption
DHCP Server	Enabled
NAT Routing	Enabled

 **NOTE:** Your Wireless Broadband Router came with factory default settings that should work for the majority of the network usage scenarios. However, there are cases where your network environment may require a different router configuration.

Setup Wizard

 [Introduction](#)

 [Launch the Setup Wizard](#)

 [Setup Wizard Screens](#)

Introduction

Setup Wizard is an easy-to-use program included on your CD. It provides simplified configuration procedures for establishing Internet connectivity on the Router. The Setup Wizard first extracts the connection settings from your active ISP connection on your computer with a cable/DSL modem. It then displays a series of graphical illustrations on how to connect the router to the network. Finally it applies the extracted settings on your router and validates its installation. If the installation cannot be completed successfully, the Setup Wizard will display troubleshooting instructions to guide you through the installation process.

In addition, the Setup Wizard also provides links to the user's guide on the CD and the Dell support website.

[Back to Top](#)

Launch the Setup Wizard

To run the Setup Wizard, perform the following steps:

Insert the CD

1. Insert the **Wireless Broadband Router Setup CD** into the CD drive on a computer that is connected directly to the Internet.

Your CD should automatically launch the Setup Wizard. If it does not, complete the following steps to start the Wizard.

- a. Click the **Start** button, and then click **Run**.
- b. Type the following text in the **Open:** field:
X:\setup.exe
where **X** is the drive letter of your CD drive.

Once the Setup Wizard has been launched, you will be guided through a series of windows. These windows are illustrated below along with an explanation on their functionalities.

Install the Control Utility

You can install the Control Utility on your computer when you step through the setup process using the Setup Wizard.

1. Insert the *Wireless Broadband Router Setup Wizard and User Guide CD* into the CD drive. Your CD should automatically launch the **Setup Wizard** program. If it does not, complete the following steps to start the Wizard.
 - a. Click the **Start** button, and then click **Run**.
 - b. Type the following text in the **Open:** field:
X:\setup.exe
where **X** is the drive letter of your CD drive.
 - c. Click the **OK** button.
2. From the main menu, click the **Installation** button, and then click either the **Setup First Computer** button or the **Setup Additional Computers** button.
3. Follow the on-screen instructions.

[Back to Top](#)

Uninstall the Control Utility

1. If the icon is displayed in the system tray in the lower right corner of the screen, right-click the icon and click **Exit**.
2. Click the **Start** button.
3. Click **Control Panel**.
The **Control Panel** window appears.
4. Click the **Add/Remove Programs** icon.
5. Click to select the **Control Utility** from the program list and remove it as instructed.

[Back to Top](#)

Start the Control Utility

The control utility program will run automatically upon each computer startup by default. If the utility does not start automatically, run the **Wireless Broadband Router Dell Control Utility** from the **Start** menu.

Once running, a router icon is created in the system tray in the lower right corner of your screen. If you have a good connection to the Internet, the system tray icon looks gray and white . You can double-click the router icon to open the utility panel.

 **NOTE:** If the icon is yellow , it indicates that the Internet connection is not active. If the icon is red , it indicates that the connection to the router failed.

[Back to Top](#)

Exit the Control Utility

When you start the control utility program, it will place a small gray and white icon  in the system tray in the lower right corner of your screen. If you want to exit the program, right-click the icon, and then left-click **Exit** to quit the program.

My Network Overview

This screen provides information about your network connection and settings. The left pane displays your connection status. The right pane displays the following network settings:

- Operation Mode
- Connection Type
- Internet IP Address
- WAN MAC Address
- LAN IP Address
- Netmask
- Network Name (SSID)
- WEP Functionality

My Network Overview

[Back to Top](#)

Wireless Settings

- **Network Name (SSID)**
The SSID is a unique network name. It is used to identify the WLAN. This name is used when connecting additional computers to your wireless router.
- **Channel**
This is the radio channel over which a communication transmission occurs.
- **Factory Default Value**
Resets the wireless settings to its factory defaults.
- **Apply**
Saves current settings.

- **Restore**

Restores previous settings.

Your router has an advanced security mechanism. It ensures the confidentiality of data, and also guards data against being modified. If you want to enable the security mechanism, click to select **Enable Wireless Security**.

Wireless Settings

WEP Settings

Wired Equivalent Privacy (WEP) encryption used in the 802.11 standard is to protect wireless communication from eavesdropping. WEP provides a way of creating an encrypted key that is shared between a wireless client (such as a notebook with a wireless PC card) and the router. This key encrypts data before it is transmitted. WEP can be implemented with a

40(64)-bit or 104(128)-bit key. For added security, change your key often. When you change the key on one wireless device, it must be changed for all wireless devices and Access Points in the network.

- **Key Format**

Can be ASCII or hexadecimal format. Hexadecimal format includes the numbers 0 through 9 and the letters A through F. ASCII format includes all alphanumeric characters.

- **Key Length**

Can be either 40(64)-bit or 104(128)-bit key length. Some wireless network cards are only able to use 40(64)-bit encryption. If all your clients are able to communicate at 104(128)-bit, then choose 104(128)-bit. If any client is only able to communicate at 40(64)-bit, choose 40(64)-bit.

- **Key1, Key2, Key3, and Key4**

Type four different keys in the **Key** fields provided to store on the Router. If you choose 40(64)-bit encryption, enter a 5-character (or 10 hexadecimal digits). For 104(128)-bit encryption, enter a 13-character (or 26 hexadecimal digits) WEP key.

- **Default Key**

Select only one key out of the four provided in the **Default Key** field.

WPA Settings

Wi-Fi Protected Access (WPA) is an upgrade to the WEP standard for securing your wireless network.

If you would like to secure your wireless network using WPA, you must have WPA support for your wireless clients. If you are using a Dell TrueMobile wireless client, you can check for the availability of WPA-enabled software updates for your wireless client at <http://support.dell.com>.

- **WPA Pre-shared Key**

All wireless clients must use this key to gain access to the network. Note that the Key format must also match the setting for the wireless clients.

- **Key Format**

Can be ASCII or hexadecimal format. Hexadecimal format includes the numbers 0 through 9 and the letters A through F. ASCII format includes all alphanumeric characters.

- **WPA Group Rekey Interval**

WPA Group Rekey Interval is used to specify the frequency of encryption key rotations.

The lower the number, the faster your encryption key will rotate; however, setting this number too low may cause your wireless network to slow down.

- **WPA Encryption**

TKIP (Temporal Key Integrity Protocol) is the most commonly used encryption method.

AES (Advanced Encryption Standard) can be used if your wireless clients do not support TKIP.

[Back to Top](#)

Network Access Control

- **Add**

Adds a new entry to the list.

- **Edit**

Allows you to edit entries.

- **Delete**

Deletes a record from the list.

- **Delete All**

Deletes all records from the list.

- **Restore**

Restores previous settings.

Network Access Control

Parental Control

Parental Control allows you to determine what type of websites are accessible through your wireless network. It also allows you to specify what time of day the Internet can be accessed.

To enable parental control, perform the following steps:

1. Click to select **Enable Parental Control**.
2. Click the **Add** button.
The **Parental Control** window appears.
3. Enter the IP address of the computer you want to control (for example, your child's computer) in the **Host IP** field.
4. Select **Allowed** or **Denied** from the **Internet Access** list.
5. Enter a time **Interval**, during which users will be allowed to access the Internet.
6. Select **allow** or **deny** for web access.

7. Specify which websites may be accessed or may not be accessed by entering their URLs in the **Website URL** field.
8. Click the **OK** button to apply, or click the **Cancel** button to exit without making any changes.
9. Click the **Apply Parental Control Settings** button on the bottom of the screen to activate the new settings.

MAC (Media Access Control)

This feature prevents specific computers within the wireless local area network (WLAN) from accessing the Internet.

To enable MAC, perform the following steps:

1. Click to select **Enable MAC Access Control**.
2. Click the **Add** button.
The **MAC Access Control: Add Entry** window appears.
3. Enter the hexadecimal MAC address (for example, 00:11:22:33:44:55) that you want to grant or deny access in the **Host MAC** box.
4. Select **Grant** or **Deny** from the **Operating Type** list.

 **NOTE:** The operating type for **ALL** records **MUST** be either **Grant** or **Deny**.

5. Click the **OK** button to apply, or click the **Cancel** button to exit without making any changes.
6. You can click on the selected record and click again on its **Host Name** to enter the desired name for this record.
7. Click the **Apply MAC Control Settings** button on the bottom of the screen to activate the new settings.

[Back to Top](#)

Gaming

In some cases, the firewall feature of the router will cause a game not to function as intended. The settings listed on the **Gaming** menu can solve these problems.

Your Router has an integrated **Network Address Translation** (NAT) firewall that rejects any unsolicited data from the Internet to access the computer on your LAN. Applications like e-mail

and web browsing are unaffected by NAT. However, some applications (such as Internet messaging and gaming applications) will not function correctly.

Gaming

Port Forwarding Settings

Port forwarding allows you to configure your router to accept unsolicited data through a specific port. The ports and protocol type (TCP, UDP, or both) will depend on what gaming service you are using.

To enable Port Forwarding, perform the following steps:

1. Click the **Add** button.
The **Gaming: New Record** window appears.
2. Type the desired name or description in the **Game Description** field.

3. Type the IP address of the device (for example, desktop computer) for gaming in the **Computer IP for gaming** field.
4. Select a transport layer protocol from the **Protocol Type** list. The options listed here are TCP (Transmission Control Protocol), UDP (User Datagram Protocol), and both.
5. Enter the incoming port number in the **Incoming Port No.** field and the outgoing port number in the **Outgoing Port No.** (also called **Destination Port**) field.

 **NOTE:** This information should be available from your gaming service.

6. Select **Enable** or **Disable** the gaming from the **State** list.
7. Click the **OK** button to apply, or click the **Cancel** button to exit without making any changes.

DMZ

Some applications experience problems when working behind a firewall. To solve this problem you can put computers outside of the firewall via the router's **DMZ** (demilitarized zone) feature. The DMZ feature disables the NAT firewall and allows all data to pass through all ports to this computer.

Follow the instructions below to enable the DMZ feature.

1. Click to select **Enable DMZ Host**.
2. Type the IP address of the computer that will run the gaming application in the **DMZ IP Address** field.
3. Click the **Apply** button to apply the new settings.

[Back to Top](#)

Remote Access

Remote Access

Allow Remote User to Configure the Device

This option allows you to configure the device from a remote location via the network.

1. Click to select **Allow remote user to configure the device**.
2. Enter the IP address of the remote administration host in the required field.
3. Enter the HTTP port number that will be used on the router in the **HTTP port number** field.
4. Click the **Apply** button to save the settings, or click the **Restore** button to restore to its previous settings.

Allow Remote User to Ping the Device

This option allows you to configure the WAN ping capability. The default setting is **disabled**. The router will not answer ping requests, so your WAN port is invisible to port scanners, which can make your network safer.

1. If you want your WAN port to be visible on the Internet, click to select **Allow remote user to ping the device**.
2. Click the **Apply** button to save the settings, or click the **Restore** button to restore to its previous settings.

[Back to Top](#)

Administration

Administration

System Rescue

System Rescue allows you to save a backup of your configuration settings.

- **Save Current System Configuration To File**
Saves the current settings as a **.pro** file.
- **Load System Configuration Manually**
Loads the backup file to restore previously saved settings.
- **Choose From The Configuration File List**
The router will automatically save a copy of backup configuration files in the file list.
You can select a file to load from the list, instead of searching for the correct file.
- **Reset to Factory Default Settings**
Resets the router to its default configuration.

Change Password

To prevent unauthorized changes to the router settings, the router is password protected. It is strongly recommended that you change the factory default password.

1. Click the **Change Password** button.
The **Password Settings** window appears.
2. Type the original password in the **Original Password** field.
3. Type the new password in the **New Password** field, and then retype it in the **Confirm Password** field to verify.
4. Type the password hint message in the **Password Hint Message** field.
5. Click the **Submit** button when you finish the setting. If you want to clear any values you have entered in any field, click the **Cancel** button.

Upgrade to New Firmware

If you are instructed to upgrade the firmware, click the **Upgrade to New Firmware** button. It will connect to the Dell website to upgrade to the latest firmware release. It is unnecessary to upgrade the firmware if your router is working properly.

[Back to Top](#)

Diagnostics

Diagnostics

You can monitor the current status of your network connection in the **Diagnostics** menu. The network detection can be activated by clicking the **Start Diagnostics** button on the bottom of the screen.

When the detection is done, the screen will display a summary of your Internet connectivity.

[Back to Top](#)

Advanced Settings

To configure the advanced settings of the router, click the **Login** button to log in to the web-based configuration tool. The web-based configuration tool allows you to set up advanced network configurations for your Wireless Broadband Router.

Web-based Configuration Tool:

Dell™ TrueMobile™ 2300 Wireless Broadband Router User's Guide

 [Overview](#)

 [Basic Settings](#)

 [Device Status](#)

 [System Tools](#)

 [Advanced Settings](#)

 [Log Off](#)

Overview

The web-based configuration tool enables you to set up advanced network configuration for your Wireless Broadband Router. Follow the instructions below to gain access to the web tool.

 **NOTE:** Microsoft Internet Explorer 4.0 or higher or Netscape 4.0 or higher must be used for the web-based configuration tool.

1. Click the **Start** button, and then click **Run**.
2. Type the following text in the **Open** box:
<http://my.router>
3. If this is the first time configuring your Router, or if the user name and password have not been changed, type **admin** in the **User Name** and **Password** fields.
4. Click the **OK** button.

The **Configuration** screen appears.

 **NOTE:** Dell technical support representatives do not support the configuration options in the **Advanced Settings** portion of the configuration program. These options are

provided for your convenience only. However, the advanced settings are fully documented and explained in this guide.

Main Menu

Dell TrueMobile 2300 Wireless Broadband Router

BASIC SETTINGS | **DEVICE STATUS** | **SYSTEM TOOLS** | **ADVANCED SETTINGS** | **HELP** | **LOG OFF**

**Dell TrueMobile 2300
Wireless Broadband Router**

Basic Settings
Use the basic settings to change the mode of your router, Wireless network name and channel, wireless security, and internet connection settings.

Advanced Settings
Use the advanced settings to change the IP address of the router, DHCP server options, Time zone, Advanced wireless settings, Parental control options, Access control options, and Administration options.

Device Status
Use the device status to check the status for each connection to your router.

System Tools
Use System tools to check the intruder log, display the routing table, perform system diagnostics, load default settings, upgrade firmware, and reset the router.

Help
Use the Help link to get on-screen help with the features of the router.

Log Off
Exit the Dell TrueMobile 2300 Wireless Broadband router configuration.

Log Off

The web-based configuration tool only allows access to one user at a time.

[Back to Top](#)

Basic Settings: Dell™ TrueMobile™ 2300 Wireless Broadband Router User's Guide

The following configuration options are included in **Basic Settings**:

 [Router Mode](#)

 [Wireless Settings](#)

 [Wireless Security](#)

 [Internet Connection Settings](#)

 [Save & Apply](#)

 **NOTE:** To implement the changes you make to the settings, you must save your settings and restart the router. Otherwise, the router uses the previous settings. If you are using the **BACK/NEXT** links to step through each screen in the **Basic Settings** portion of the web-configuration tool, you ultimately reach the **Save & Restart** page. Click **Save & Restart** to commit the changes, and the router will reboot automatically with the new settings in effect.

Router Mode

The router has two operating modes: **Gateway** mode and **Access Point** mode.

Router Mode

The screenshot shows the web configuration interface for a Dell TrueMobile 2300 Wireless Broadband Router. The top navigation bar includes the Dell logo and tabs for BASIC SETTINGS, DEVICE STATUS, SYSTEM TOOLS, ADVANCED SETTINGS, HELP, and LOG OFF. A left sidebar contains a 'Main menu' with buttons for ROUTER MODE, WIRELESS SETTINGS, WIRELESS SECURITY, INTERNET CONNECTION SETTINGS, and SAVE & APPLY. The main content area is titled 'ROUTER MODE' and displays two radio button options: 'Gateway Mode' (which is selected) and 'Access Point Mode'. Below these options are 'NEXT >' and 'HELP' buttons. A note at the bottom states: 'NOTE: Please click 'Next' to save the settings..'. The footer indicates 'Copyright © 2003'.

Gateway mode allows your router to create a wireless network to access the broadband router. Wired and wireless network devices share the same Internet connection through **Internet** port in the Gateway mode. However, some ISPs may request you to do the additional setup, such as PPPoE, before using your router to access the Internet.

Access Point (AP) mode allows your router to act as a bridge between wireless devices and Ethernet devices in the existing network. All wired and wireless devices are located in the same class C subnet. Internet port is useless here. Thus, Access Point mode is here to help you set up a single isolated network.

 **NOTE:** If the device is put in AP mode, the **Internet Connection Settings** will not be available.

The **Gateway** mode is the default setting in Router.

BASIC SETTINGS DEVICE STATUS SYSTEM TOOLS ADVANCED SETTINGS HELP LOG OFF

Main menu

ROUTER MODE

WIRELESS SETTINGS

WIRELESS SECURITY

INTERNET CONNECTION SETTINGS

SAVE & APPLY

WIRELESS SETTINGS

Network Name (SSID) wireless

Channel 6

 **NOTE:** You must change each client's wireless adapter settings to match the Router settings. Use the factory defaults for the Router, unless the default settings have been changed. In this case, note the changes and use the new settings for each wireless network card. For assistance configuring a wireless network card, see the card's documentation.

Setting	Possible Values
Network Name (SSID)	(wireless by default)
Channel	(6 by default)

Network Name (SSID)

The network name is a value that identifies a collection of **wireless** devices found in a particular network. The default value for the Router is **wireless**. All workstations and access points must use the same SSID to be able to communicate with one another.

The SSID is a 32-character field, and the value is case sensitive.

Channel

The Router can operate on a variety of channels. Routers within close proximity to one another must be on different channels. If you have just one router, then the default, channel 6, is probably adequate. If you have multiple access points in your network, it is suggested to stagger the channels for each router. It is advisable to use the default unless there is a specific reason for changing the channel, such as interference from microwaves, cellular phone towers, or other access points in the area.

[Back to Top](#)

Wireless Security

Data encryption provides added security by encoding network communications using an encryption key. Your Router, in conjunction with wireless network adapters that support encryption, can scramble your transmitted data to make it difficult for someone to eavesdrop or intercept your information. Two methods of data encryption are available: **Wired Equivalent Privacy** (WEP) and **Wi-Fi Protected Access** (WPA). If you wish to enable wireless security, click to select **Enable Wireless Security**.

Wireless Security

The screenshot shows the configuration interface for a Dell TrueMobile 2300 Wireless Broadband Router. The top navigation bar includes the Dell logo and tabs for BASIC SETTINGS, DEVICE STATUS, SYSTEM TOOLS, ADVANCED SETTINGS, HELP, and LOG OFF. The left sidebar contains a 'Main menu' with buttons for ROUTER MODE, WIRELESS SETTINGS, WIRELESS SECURITY (which is highlighted), INTERNET CONNECTION SETTINGS, and SAVE & APPLY. The main content area is titled 'WIRELESS SECURITY' and contains the following text: 'Data encryption provides added security by encoding network communications using an encryption key. The longer the wep key is, the stronger the encryption.' Below this text is a checkbox labeled 'Enable Wireless Security'. At the bottom of the main area are three buttons: '< BACK', 'NEXT >', and 'HELP'. A note at the bottom states: 'NOTE: Please click "Next" to save the settings.' The footer of the page reads 'Copyright © 2003'.

NOTE: Please click "Next" to save the settings.

Copyright © 2003

WEP

If you wish to enable WEP encryption, click to select **WEP** in the **Network Authentication** list.

Setting	Possible Values
Key Format	Hexadecimal Digits / ASCII Characters
Key Length	40 bits (5 characters) / 104 bits (13 characters)
Key1, Key2, Key3, Key4	<user-defined>

There are two levels of WEP encryption: 40(64)-bit and 104(128)-bit, with 104(128)-bit being the more secure of the two. The WEP encryption keys are simply a set of hexadecimal numbers or ASCII characters that you choose. Each Router and every wireless workstation must use the same WEP encryption key to communicate. For more information on encryption, see the [Wireless Networking Overview - Encryption](#) section of this user's guide.

- **Key Format**

Key format can be in ASCII or hexadecimal format. Hexadecimal digits include the numbers 0 through 9 and the letters A through F. If you select ASCII format, you can enter any character.

- **Key Length**

Key length can be either **40(64)-bit** or **104(128)-bit**. Larger key lengths are more secure. Some wireless network cards are only able to use 40(64)-bit encryption. If all your clients are able to communicate at 104(128)-bit, choose 104(128)-bit.

- **Key**

If you choose 40(64)-bit encryption, enter a 5-character (or 10 hexadecimal digits) WEP encryption **Key** in the fields provided. For 104(128)-bit encryption, enter a 13-character (or 26 hexadecimal digits) WEP key in the fields provided. You have the option of entering four different keys to store on the Router. Select only one key out of the four provided in the **Default Key** drop-down list. For added security, change your key often. When you change the key on one wireless device, remember that it must be changed for all wireless devices and access points in the network.

 **NOTE:** If you are adding the Router to an existing network and will be using an existing encryption key for the wireless clients, contact the person in charge of the network. The same key must be used when configuring the encryption for the Router. The administrator must make any changes to all access points and wireless clients on a network. Changing the key on just one access point or wireless client disconnects it

from the rest of the network.

WPA

If you wish to enable WPA encryption, select **WPA** from the **Network Authentication** list.

WPA is an upgrade to the WEP standard for securing your wireless network.

If you would like to secure your wireless network using WPA, you must have WPA support for your wireless clients. If you are using a Dell TrueMobile wireless client, you can check for the availability of WPA-enabled software update for your wireless client at <http://support.dell.com>.

- **WPA Pre-shared Key**

WPA Pre-Shared Key (PSK) is a field where the password is entered. All wireless clients must also use this password to gain access to the network. Note that the Key format must also match the setting for the wireless clients.

- **Key Format**

Key Format is a box that lists 2 items: **Hexadecimal** Digits (numbers 0 through 9 and letters A through F) and **ASCII** Characters (any letter, number, or symbol). Select the proper format for your key. If your wireless client(s) only support one of the two formats, be sure to specify the correct one.

- **WPA Group Rekey Interval**

WPA Group Rekey Interval is used to specify the frequency of encryption key rotations. The lower the number, the faster your encryption key will rotate, however, setting this number too low may cause your wireless network to slow down.

- **WPA Encryption**

WPA Encryption has 2 choices: **TKIP** (Temporal Key Integrity Protocol) is the most commonly used encryption method. **AES** (Advanced Encryption Standard) can be used if your wireless clients do not support TKIP.

[Back to Top](#)

Internet Connection Settings

NOTE: The Setup Wizard enters the required cable/DSL ISP settings into the router after you complete the installation successfully. These settings should only be changed manually if the Setup Wizard is unsuccessful.

 **NOTE:** If the device is put in AP mode, the **Internet Connection Settings** will not be available.

Your ISP Requires You to Input Host Computer Name or Domain Name

If your ISP requires that you input a host computer name or domain name, click to select **Your ISP requires you to input Host Computer Name or Domain Name**. Type the appropriate values in the fields provided.

 **NOTE:** Host computer names and domain names are only used by cable modem ISPs.

Internet Connection Settings

The screenshot shows the 'Internet Connection Settings' page of a Dell TrueMobile 2300 Wireless Broadband Router. The page has a blue header with the Dell logo and the router model. Below the header is a navigation bar with tabs: BASIC SETTINGS, DEVICE STATUS, SYSTEM TOOLS, ADVANCED SETTINGS, HELP, and LOG OFF. On the left is a 'Main menu' with buttons for ROUTER MODE, WIRELESS SETTINGS, WIRELESS SECURITY, INTERNET CONNECTION SETTINGS (highlighted), and SAVE & APPLY. The main content area is titled 'ISP (BROADBAND) SETTINGS' and contains two checked options: 'Your ISP requires you to input Host Computer Name or Domain Name' and 'Your ISP requires you to input WAN Ethernet Mac'. The first option has input fields for 'Host Name' (lindbaekXXX) and 'Domain Name' (rr.com). The second option has a 'Mac Address' field with six boxes containing the values 00, 90, 4B, 34, A5, and E4. Below these is a 'Connection Type' dropdown menu set to 'Cable Modem'. At the bottom, there is a section for 'Cable Modem Settings' with a message: 'Please setup the above settings for your cable modem if needed .'

Your ISP Requires You to Input WAN Ethernet MAC

If your ISP requires that you input a WAN Ethernet MAC address, click to select **Your ISP requires you to input WAN Ethernet MAC**. In the field provided, type the public WAN (cable/DSL) MAC address assigned to your Router. You can find the WAN MAC address on

the back panel of the Router or on the Device Information page in the web-based configuration tool.

Connection Type

Select the connection type from the list. Four options are available.

- Cable Modem
- DSL (Static)
- DSL (PPPoE)
- PPTP

Cable Modem Settings

No additional settings are required. Make sure that the settings listed are correct.

DSL Static IP Settings

In the fields provided, type the IP address, IP subnet mask, ISP gateway address, and *Domain Name Server* (DNS) IP address provided by your ISP.

DSL PPPoE Settings

Point to Point Protocol over Ethernet (PPPoE) is a proposal specifying how a host computer interacts with a broadband modem (for example, DSL, cable, or wireless) to access the network. In many respects PPPoE is similar to the **Dialup Networking** approach. If you have a DSL (PPPoE) Internet connection, enter the PPPoE user name and password provided by your ISP.

PPTP Settings

The following settings should be provided to you by your ISP.

- IP Address
- Subnet Mask
- Server IP Address
- User Name
- Password

If your ISP specifies that you use PPTP (Point-to-Point Tunneling Protocol) as your connection to the Internet, you cannot use the provided Setup Wizard to automatically set up your router. Follow the instructions below to set up your connection manually:

1. Remove the Ethernet cable from the back of the computer you currently connect with, and connect it to the Internet port of your Router.
2. Connect the Ethernet cable provided to any of the four LAN ports, and the other end to your computer.
3. Configure your computer's Ethernet adapter to obtain an address automatically.
4. See Windows Help for information on how to configure your computers network adapter.

 **NOTICE:** If you are charged for your Internet Connection by the minute, unplug the network cable from the Internet port on the Router when Internet access is no longer desired.

[Back to Top](#)

Save & Apply

Use the **Save & Apply** page to submit all the network setting changes you have made. Click the **Save & Restart** button to update the network configurations for your Router.

New settings are written to the firmware, and the Router reboots automatically.

 **NOTE:** If you have wireless clients in your network, you must configure the clients' wireless network cards to match the settings for the Router.

Save and Apply

Device Status: Dell™ TrueMobile™ 2300 Wireless Broadband Router User's Guide

The Device Status screen displays the basic network settings for your Wireless Broadband Router. When changes are made to the network settings, those changes are updated on this screen. In addition, it graphically displays the current connection status for the Router and other devices in your network. Connections between network devices are shown with a yellow arrow. Inoperative connections are represented by one red X through the yellow connection line.

 **NOTE:** The router offers two ways to check the status of your network. One is the **Device Status** feature in the web configuration tool mentioned here. The other is through the Windows-based [Control Utility](#).

Device Status

The following connections are displayed on the Device Status page:

Device	Indication
Internet	An inactive cable/DSL connection indicates that either the cable is unplugged or the Router has not received an IP address. An active connection indicates the WAN interface of the router has a valid IP address and your computers can connect to the Internet via the router.
Wired Client (LAN)	Shown as an active connection when a wired client is configured and physically connected to your network, and inactive when the Ethernet cable is disconnected from the computer.

Wireless Client	Shown as an active connection when a wireless client is configured for your network, and inactive when there is no wireless client connected to your router.
-----------------	--

When the Router acts as a DHCP server, it assigns IP addresses to the clients on the network. These IP addresses are displayed in the **DHCP Log** below the Device Status figure.

WAN Ethernet Settings

Refer to the left side of the screen for the following WAN Ethernet settings and the Internet protocol (IP) settings for the Router:

Setting/Device	Information Displayed
Internet	The connection to the Internet is Active/Not Active
Router IP	IP address assigned to the Router
LAN MAC	MAC address for the LAN and Wireless interfaces
WAN MAC	MAC address for the WAN interface
Router Name	The name for the Router (the default is Router)
Firmware Version	Version number of the firmware currently installed on the Router and the release date of the firmware
Wireless Channel	Radio channel on which the Router is communicating on the air
Network Name	A unique network name that identifies the network. It is also known as SSID (Service Set Identifier). When a client station tries to connect to the router, the user must know the router's SSID first.

The following buttons appear on the left navigation bar:

Button	Action
RELEASE	Releases the IP address that the Router has been assigned from your ISP. If the Router has been configured to receive a static IP address, clicking Release does not release this IP address.
RENEW	Renews the IP address with a DHCP server provided by your

	ISP. If the Router has been configured to receive a static IP address, clicking Renew does not renew the IP address.

System Tools: Dell™ TrueMobile™ 2300

Wireless Broadband Router User's Guide

Use the System Tools section to view the intruder detection log, routing tables, and system diagnostics regarding the device settings and status. The System Tools section also includes features to restore the default settings, upgrade the firmware for the Router, and reset the unit.

Use the following pages in the web-based configuration tool to access the System Tools:

 [Intruder Detection Log](#)

 [Display Routing Table](#)

 [System Diagnostic](#)

 [Load Default Settings](#)

 [Upgrade Firmware](#)

 [Reset Device](#)

Intruder Detection Log

Indicator	Description
Event	Type of attack that the router detects
Time	Based on the timestamp of the IP packet, plus or minus the time offset
Source	IP address that the packet came from
Dest (=Destination)	Usually the IP address for the Router

Port	Port number
------	-------------

The system can alert you via e-mail to any attempted intrusion.

1. Click to select **Email Alert Enable**.
2. Type the e-mail address that you want the alert sent to in the **Email Address** field.
3. Click the **Submit** button.

The figure below shows an example of an entry of an intrusion attempt event from a computer with IP address 192.168.2.60 (Source) targeted at the router's port number 80 at time 12 AM:1 Min: 5 Sec.

Display Routing Table

Indicator	Description
Type	The type of routing. This can be either of the following: LAN or WAN interface (INTF) Static routing
Destination LAN IP Address	Either an entire network or a specific IP address. An IP address ending in .0 refers to a network.
Subnet Mask	Must follow the subnet mask rules
Gateway IP Address	To communicate with an IP address matching the destination IP Address, the Router sends all traffic through the gateway IP address listed here.
Hop Count	The number of routers the packet has passed through to its destination. Hop count is used to measure the distance between a source and a destination. If there are 3 routers between the source and the destination nodes, the hop count for the packet will be 3 when it arrives at its destination node.

The figure below shows three network routes that your router currently possesses. 192.168.2.0 is the destination network connected to one of your router's interface ports (LAN or WAN) and the IP address and Subnet Mask for this interface is 192.168.2.1 and 255.255.255.0, respectively. The number of routers (Hop Count) the packet passed through is 1. Also in the same example, the destination with 0.0.0.0 network and 0.0.0.0 Subnet Mask is the default route for your router, where every packet that left unmapped to any other route will be mapped to this route. The outgoing default gateway IP address is 192.168.1.254.

Load Default Settings

The Load Default Settings page allows you to reload the factory default configurations that came with the device. When this option is used, the default IP address is reset to the factory default value (192.168.2.1). This is equivalent to pressing and holding the **Reset** button on the back panel of the device for more than 3 seconds (for more details, refer to [A Look at the Hardware](#)).

 **NOTICE:** Loading the default settings option will cause the current settings for your Router to be lost.

Load Default Settings

Click the **Start** button to reload the default settings.

[Back to Top](#)

Upgrade Firmware

Dell periodically releases firmware updates to provide improved performance or capabilities. Use the firmware upgrade feature to easily upgrade the firmware on your Router. You can check the Dell support website, support.dell.com, to see if there are any new upgrades. Download the new firmware first before upgrading and save it to one of the clients in your network. To upgrade the firmware, type the firmware file path into the box, or click the **Browse** button to choose a firmware file to upgrade to.

 **NOTE:** Make sure the file you choose is an actual Wireless Broadband Router firmware file.

Upgrade the Firmware

The screenshot shows the web interface of a Dell TrueMobile 2300 Wireless Broadband Router. At the top, there is a blue header with the Dell logo on the left and the router model name on the right. Below the header is a navigation bar with tabs for BASIC SETTINGS, DEVICE STATUS, SYSTEM TOOLS (which is highlighted), ADVANCED SETTINGS, HELP, and LOG OFF. On the left side, there is a 'Main menu' with several buttons: INTRUDER DETECTION LOG, DISPLAY ROUTING TABLE, SYSTEM DIAGNOSTIC, LOAD DEFAULT SETTINGS, UPGRADE FIRMWARE (which is highlighted in blue), and RESET DEVICE. The main content area is titled 'FIRMWARE UPGRADE' in green. It contains instructions to enter the firmware file path and click START. There is a text input field for the 'Firmware Upgrade File:' and a 'Browse...' button next to it. Below the input field is a yellow 'START' button. At the bottom of the main content area, there is a red 'WARNING' message stating that Dell does not recommend upgrading from a wireless client and recommends using a LAN cable connection. The footer of the page shows 'Copyright © 2003'.

FIRMWARE UPGRADE

Enter the firmware file path into the box and click **START** to proceed with the new firmware upgrade.

Firmware Upgrade File:

START

WARNING: Dell does not recommend upgrading the Dell TrueMobile 2300 Wireless Broadband Router from a wireless client. Dell recommends connecting to your Dell TrueMobile router with a LAN cable connection to perform your firmware upgrades.

Copyright © 2003

Click the **Start** button when you have chosen a file. After the firmware is written to the Router, the home page will be loaded automatically. While the Router resets, the **Power** light on the front panel of the router blinks.

[Back to Top](#)

Reset Device

Use the Reset Device function if a system failure occurs. This feature does **not** reload the factory default settings. It simply resets the device to the network settings that existed on the device before the system failure occurred. This is equivalent to unplugging the device and plugging it back in or pressing the reset button for less than 3 seconds until the **Power** light starts to blink. No settings are lost.

➡ **NOTICE:** If you were in the process of updating the network settings, those changes are lost when the device is reset.

Click the **Start** button to reset the Router to its **current firmware settings**. While the Router is reset, the **Power** light on the front of the router blinks.

 **NOTE:** Dell technical support representatives do not support the configuration options in the Advanced Settings portion of the configuration program. These options are provided for your convenience only. However, the advanced settings are fully documented and explained in this guide.

The options **Port Forwarding Settings** and **Static Routing** are invisible if you are in Access Point Mode.

After making changes to **Advanced Settings** and clicking the **Submit** button, click the **Save & Restart** button for the changes to take effect.

Advanced IP Settings

The Dell TrueMobile 2300 Wireless Broadband Router comes with an assigned IP address and IP subnet mask. These settings apply only to the local network portion of the router. If you are installing the unit on an existing network or simply want to change these values, make sure the IP subnet mask is the same for all devices on your network. The network portion of the IP address must also be the same for all devices on your network.

 **NOTE:** Dell strongly suggests you do not change the IP address unless there is a specific reason for doing so.

While you are changing the IP address, be aware of the following:

- Changing the IP address of the Router also changes the IP address pool if the DHCP server is enabled.
- If you are using the Router with a cable modem or DSL line, you should assign a **private** IP address. Private IP addresses are in one of three ranges:
 - 10.0.0.1-10.254.254.254
 - 172.16.0.1-172.31.254.254
 - 192.168.0.1-192.168.254.254
- You must use the new IP address to access the web-based configuration tool.

 **NOTE:** You should only change the IP address or IP subnet mask if you are installing the Router on an existing wired network and the DHCP server function for your Router is disabled in the **Advanced Settings**. For more information, contact your network administrator.

To: 192.168.2.

Lease Time: days hours minutes seconds

IP Address Reservations		
IP ADDRESS	MAC ADDRESS	EDIT

SUBMIT **HELP**

NOTE: Please click 'Submit' to save the settings.

Enable DHCP Server Functions

By default, the Router is set to function as a DHCP server. If you are installing the unit on an existing network that already has a DHCP server or simply do not want the Router to function as the network's DHCP server, click to deselect **Enable DHCP Server Functions** to disable the DHCP server function.

IP Address Pool Range

The IP Address Pool Range section provides a means of controlling a low and high value for the IP addresses on a network. Use the indicated fields to define the range of IP addresses you would like the Router to provide to DHCP clients. The valid range of numbers you should enter is between 1 and 254.

The lease time is the amount of time a user will be allowed to use the IP address assigned by the DHCP server. You may specify the lease time that DHCP server offers for the client to use the IP address. This setting is especially useful on campuses or other environments where users change frequently.

IP Address Reservation

Specific IP addresses may also be reserved for particular devices in a network. The **IP Address Reservation** fields allow you to reserve up to four IP addresses for a specific system. The **Computer MAC** field is the MAC address of the network card on the client computer. Use the input fields under **IP Address** to indicate the IP address for those devices that should use a manually defined IP address.

Time Zone

Time Zone

The screenshot shows the web interface of a Dell TrueMobile 2300 Wireless Broadband Router. The top navigation bar includes the Dell logo and tabs for BASIC SETTINGS, DEVICE STATUS, SYSTEM TOOLS, ADVANCED SETTINGS (which is highlighted), HELP, and LOG OFF. A left-hand menu lists various settings: ADVANCED IP SETTING, DHCP SERVER SETTING, TIME ZONE (highlighted), ADVANCED WIRELESS, PARENTAL CONTROL, ACCESS CONTROL SETTINGS, PORT FORWARDING SETTINGS, and STATIC ROUTING. The main content area is titled 'TIME ZONE SELECTION' and displays the current date and time as 'Mon Jun 30 01:04:22 2003'. It prompts the user to 'Please choose your local time zone:' and features a pull-down menu currently showing '(GMT-08:00) Pacific Time (US/Canada), Tijuana'. Below the menu is a checkbox labeled 'Enable Daylight Saving' which is checked. At the bottom of the form are 'SUBMIT' and 'HELP' buttons. A note at the very bottom states: 'NOTE: Please click 'Submit' to save the settings.'

Use the **Time Zone** page to select your local time zone from the pull-down list. The **Time Zone** Settings affect the Intruder Detection Log. This setting overrides the time stamp on IP packets that are in Greenwich Mean Time (GMT).

[Back to Top](#)

Advanced Wireless

Advanced Wireless

The screenshot shows the web interface of a Dell TrueMobile 2300 Wireless Broadband Router. The top navigation bar includes 'BASIC SETTINGS', 'DEVICE STATUS', 'SYSTEM TOOLS', 'ADVANCED SETTINGS' (which is highlighted), 'HELP', and 'LOG OFF'. A left sidebar contains a 'Main menu' with buttons for 'ADVANCED IP SETTING', 'DHCP SERVER SETTING', 'TIME ZONE', 'ADVANCED WIRELESS' (highlighted), 'PARENTAL CONTROL', 'ACCESS CONTROL SETTINGS', 'PORT FORWARDING SETTINGS', and 'STATIC ROUTING'. The main content area is titled 'ADVANCED WIRELESS' and contains the following settings:

- ☒ Enable Wireless
- ☐ Hide my wireless network
- Mode: 802.11b and 802.11g (dropdown menu)
- Network Name (SSID): wireless (text input)
- Transfer Rate :: Auto (dropdown menu) (Default: Auto)
- Channel : 6 (dropdown menu)
- ☐ Advanced options
 - Beacon interval: 100 (1-65535)
 - RTS Threshold: 2346 (0-2347)
 - Fragmentation threshold: 2346 (256-2346)

Enable Wireless

This setting enables radio transmission and reception on the Router.

Hide my wireless network

Checking this disables the Wireless Broadband Router to send out beacon packets to the wireless network. It is deselected by default and other users can easily find and make association to your Wireless Broadband Router with the use of a site survey tool.

If you want to increase wireless network security, you can enable this feature.

Mode

Router is 802.11g-compatible. You can select **both b & g** (dual mode), or **802.11b**, or **802.11g** from the **Mode** list.

SSID

Service Set Identifier (SSID) is a 32-character name that uniquely identifies all the computers and equipment that make up the wireless network.

Transfer Rate

Transfer rate can be set to automatic or some other fixed value. It is recommended that you set the transfer rate to automatic (Auto) to allow the wireless network devices to transmit at a rate they deem optimum at any given point of time.

Channel

The channel settings let you set the channel for this router. The radio channel is the place over which a communication transmission occurs. The operating channel number depends on the regulatory domain.

NOTE: If you want to configure the settings of Beacon Interval, RTS Threshold, Fragmentation Threshold, and DTIM Interval, ensure that **Advanced Options** is selected first.

Beacon Interval

The amount of time in Kusecs (one Kusec equals 1,024 microseconds) between radio beacons from the Router to its client stations. The value range is from 1 to 65535.

RTS Threshold

The packet size above which the Router will issue a Request to Send before sending the packet.

RTS (Request to Send) mechanism prevents the **Hidden Node** problem. When two stations are within range of the same Access Point (AP) but are not within range of each other, they are hidden nodes for each other. The packets from these two stations may collide if they arrive at the AP at the same time. To prevent data collision with the hidden node, you can activate RTS mechanism. If RTS mechanism is activated, the station will send a RTS first to inform the AP that it is going to transmit the data. Then, the AP will reply with the CTS (Clear to Send) to all

stations within its range to notify all other stations and reserve the bandwidth for your data.

The RTS threshold controls what size data packet would issue a RTS. Only when the packet exceeds the RTS threshold, the device will send a RTS before sending the packet. There is trade-off to consider what value you should set for the RTS threshold. Small values cause RTS to be sent more often, and it would waste the bandwidth. However, the more often RTS packets are sent, the sooner the system can recover from collisions. It is recommended to use the default value or only minor reductions of this default value. The value range is from 0 to 2347.

Fragmentation Threshold

The fragmentation threshold, specified in bytes, determines whether data packets will be fragmented and at what size. Packets that are smaller than the specified fragmentation threshold value will not be fragmented. Packets that are larger than the fragmentation threshold will be fragmented into smaller packets and transmitted a piece at a time instead of all at once. Thus, it will reduce the need for retransmission and improve overall network performance. Fragmentation is activated usually when the system is in heavy traffic and interference environment. The setting must be within the range of 256 to 2346 bytes. It is recommended to use the default value or only minor reductions of this default value.

DTIM Interval

DTIM (Delivery Traffic Indication Message) Interval, always a multiple of the beacon period, determines how often the beacon contains a traffic indicator map (TIM). The TIM alerts stations in sleep state to stay awake long enough to receive their data frames. The value range is from 1 to 255.

Wireless Bridge

Wireless bridging can be used to increase the coverage of your wireless network and/or to provide wired access to remote computers. You need two or more Wireless Broadband Routers to set up wireless bridging.

To set up wireless bridging, configure the wireless settings for all of your Wireless Broadband Routers to the same settings.

Configuring your router for Wireless Bridging:

1. Ensure **Enable Wireless** is checked.
2. Type your wireless network name in the **Network name (SSID)** field if you want to change it from the default setting.
3. Ensure **Advanced Options** is deselected.
4. Enable **Wireless Bridge**.
5. Type the Wireless MAC address (fields) of the other Wireless Broadband Router(s) that you want to bridge.

NOTE: To connect two bridges together, enter the MAC address of the bridge at the other end. To connect three bridges together, enter the MAC addresses of the other two bridges in the bridge acted as the multipoint center. The MAC address of the center bridge is the only address that needs to be entered into the other bridges.

6. Click the **Submit** button.

7. Click the **Save & Restart** button.
8. When your web browser returns to the main page of the Router, the device has successfully restarted with the new settings.
9. Repeat the steps above for each Wireless Broadband router you want to bridge.

 **NOTE:** Ensure all routers are set to same wireless settings. Also, all router(s) not directly connected to Internet should be configured to Access Point mode.

☐ Enable DMZ Host --DMZ IP Address : 192.168.2.

Custom Port Forward Settings							ADD
Service	Enable	Incoming Ports	Destination IP Address	Destination Port	type	EDIT	

PORT TRIGGERING

SUBMIT **HELP**

NOTE: Please click 'Submit' to save the settings.

DMZ

The DMZ (demilitarized zone) feature allows access to all ports. (For example, if you have problems hosting a game server, you can choose this option. This will open all ports to your game server.)

1. Click to select **Enable DMZ Host**.
2. Type the IP address of the computer that you want to run the gaming application in the **DMZ IP Address** field.
3. Click the **Submit** button to activate the setting.

 **NOTE:** Configuring the Router in DMZ mode is useful if you want to play certain games through the Router, but the ports cannot be opened with all other existing configuration tools.

 **NOTICE:** Opening a service to the Internet causes security concerns. Pay careful attention to security alerts, and make sure that strong access controls and authentication are in place before allowing access to any services.

Custom Port Forwarding Settings

Port Forwarding may be more difficult than DMZ to configure. However, it provides a relatively safe way of running an Internet application or providing an Internet service from behind a firewall since only a single port (or a range of ports) is exposed to the Internet. You can configure this port forwarding setting to create a custom rule that defines a specific port and protocol for data traffic to pass through to the specific computer on your LAN.

An example is an HTTP server running on your LAN, which you want to be available to the Internet. Your public IP address (that your ISP gives you) is X.X.X.X (The X is a number), and you have a computer hosting the HTTP server at LAN address 192.168.2.2 on your Router (192.168.2.1) controlled LAN. You can configure 192.168.2.2 to have port forwarding for port 80 (HTTP), then users on the Internet can go to <http://X.X.X.X> and get the HTTP server (192.168.2.2). The data traffic entering service port 80 will be directed to the computer (192.168.2.2), and other computers on your LAN will not see this data traffic.

For some Internet applications (such as Internet messaging and gaming applications), you can configure this port forwarding setting so that these applications can function correctly behind the firewall. These applications are required to have specific TCP/UDP ports. The ports for

these applications and the protocol type will depend on what Internet services you are using. Check with your service provider or application's user manual to have the information first.

Make sure you have the following ports set up as described below.

1. Click to select **Enable**.
2. Enter the desired name or description in the **Service Name** field.
3. In the **Incoming Ports** field, enter a range of ports. If you want to specify only a single port number, enter the same number in both fields.
4. In the **Destination IP Address** field, enter the IP address of the computer you want to receive the connection request.
5. In the **Destination MAC Address** field, enter the MAC address of the computer you want to receive the connection request.
6. In the **Destination Port** field, enter a port number or a range of ports of the machine to which you are mapping.
7. In the **Port type** field, select TCP, UDP, or both protocols. The protocol could be specified in your application's documentation.
8. Click the **Submit** button to activate the setting.

For example, if you want to play the game Fighter Ace II on a computer with an IP address of 192.168.2.3, enter **3** for the **Destination IP Address**. Find the MAC address of this computer and enter it for the **Destination MAC Address**. Select **TCP** as the **Port type**. Enter **50000** and **51000** for two fields of **Incoming Ports** and also for the **Destination Port**. Click **Submit** button to activate the setting. For other games or services, consult the application's user manual.

The steps below show how to find the MAC address of the computer in Windows 2000 and XP.

1. Click the **Start** button, and then click **Run**.
2. In the **Open:** field, type the following text:
cmd
3. Click the **OK** button.
4. At the command prompt, type the following text to obtain the **Physical Address**(MAC address):
ipconfig/all

Commonly Used Ports

Services	Protocol Type	Ports
----------	---------------	-------

HTTP (WEB Server)	TCP	80
FTP	TCP	20, 21
TELNET	TCP	23
SMTP (Mail Server)	TCP	25
POP3 (Mail Server)	TCP	110
IRC	TCP	6667
NNTP (News Server)	TCP	119

Port Triggering

Port triggering allows the router to watch outgoing data for a specific port number. The IP address of the computer that sends the data is remembered by the router, so that when the requested data returns through the router, the data will be passed to the specific computer by way of IP address and port mapping rules. The router opens the port when the Port Triggering happens. When the computer running the application stops sending the data through this port, the router will close the port.

1. click to select **Enable**.
2. Enter the desired name or description in the **Application Name** field.
3. In the **Trigger Port** field, enter a port number. Check with your Internet application provider for more information on what Trigger Port it is using.
4. Select TCP (Transmission Control Protocol), or UDP (User Datagram Protocol), or both protocols as the **Trigger Port Type**.
5. Specify the range of the **Public Ports** by typing the start and end port numbers in the required fields.
6. Select TCP (Transmission Control Protocol), or UDP (User Datagram Protocol), or both (TCP and UDP) as the **Public Port Type**.
7. Click the **Submit** button to activate the setting.

Click the **Submit** button to store the changes.

Static Routing

Static Routing

The screenshot shows the configuration interface for a Dell TrueMobile 2300 Wireless Broadband Router. The top navigation bar includes links for BASIC SETTINGS, DEVICE STATUS, SYSTEM TOOLS, ADVANCED SETTINGS (which is highlighted), HELP, and LOG OFF. A left sidebar contains a 'Main menu' with buttons for ADVANCED IP SETTING, DHCP SERVER SETTING, TIME ZONE, ADVANCED WIRELESS, PARENTAL CONTROL, ACCESS CONTROL SETTINGS, PORT FORWARDING SETTINGS, and STATIC ROUTING (which is highlighted). The main content area is titled 'STATIC ROUTING TABLE' and contains three input fields for configuring a static route: 'Destination IP Address', 'Subnet Mask', and 'Gateway IP Address'. Each field is represented by four individual input boxes for the octets of the IP address. Below these fields is an 'ADD' button. At the bottom of the configuration area is a table with four columns: 'Del', 'Destination IP Address', 'Subnet Mask', and 'Gateway IP Address'. Below the table are 'SUBMIT' and 'HELP' buttons. A note at the bottom states: 'NOTE: Please click "Submit" to save the settings.'

Del	Destination IP Address	Subnet Mask	Gateway IP Address
-----	------------------------	-------------	--------------------

Static routes are manually configured routes to remote networks. That is, the route is predefined and is not discovered by the **Routing Information Protocol (RIP)**, as in dynamic routing. Static routing allows you to assign a gateway to an IP address or network. If there are routers on your internal network that do not function with RIP 1 or 2, you can set up a static route to those routers.

The advantage to using static routing is that network traffic is reduced; thus, static routing is beneficial for slow Internet connections. Routing using static routes is practical for small networks. For larger networks, the router needs to dynamically keep track of changes in the physical wiring of the network, and the use of dynamic routing (RIP) is recommended.

➡ **NOTICE:** The Static Routing settings are intended for advanced network administrators only. Do not change these settings unless you are certain of the correct values.

You may not be able to access the configuration tool if invalid information is entered.

To use static routing, manually add the Destination IP Address, Subnet Mask, and Gateway IP Address for each route you are adding to the Static Routing Table, and click **Add**. If you are routing to an entire network, the last number in the destination IP address should be a zero (0); for example, 192.168.0.0.

 **NOTE:** In static routing, the Router does **NOT** dynamically discover routing information and does **NOT** use RIP. The Router currently does **NOT** support RIP.

Use the fields beside each route and the **Delete** button to remove static routes from the Static Routing Table.

Administration Settings

Password Settings

The Router uses a password to authenticate the user before allowing changes to be made to any network settings. If you would like to change the current password, click to select **Change Your Password** and enter the new password in both **New Password** and **Retype Password** fields. Write down the password and keep it in a secure location for future reference.

System Administration

- **HTTP Port No.**
Do not change the **HTTP Port** value unless you have reason to do so. Typically, web servers listen for incoming web requests on port 80.
- **Allow remote user to configure the device**
If you would like a remote user to be able to administer your Router over the Internet, click to select titled **Allow remote user to configure the device**. Enter the IP address for the remote administration host computer.
- **Allow remote user to ping the device**
Click to select **Allow remote user to ping the device** to enable your Router to be pinged by any user on the Internet. This feature is helpful if you want to let other Internet users to click to select the status of your Router.

- **Enable UPnP function** UPnP stands for Universal Plug and Play, a protocol which allows UPnP-enabled client computers, such as Windows XP, to discover and configure the Router. One of most common use of UPnP on the router is to open ports to allow application-specific data to be forwarded through the router for various Internet services or gaming applications. The router detection and the router configuration process can be carried out automatically by the UPnP-enabled client applications such as **MSN Messenger** so you won't have to do it manually. Click to select **Enable UPnP function** to enable this service.

If you have an Windows XP system, you can use it to access and control the router while the router's UPnP function is enabled. Here are some examples of what you can do with UPnP from your Windows XP system.

Example 1: Access the router's web configuration tool without knowing its IP address.

1. Double-click the **My Network Neighborhood** icon from the desktop.
2. Double-click the **Broadband Router** icon that is created for your router.
This will bring up the authentication screen of the router's Web configuration tool.
3. Type the correct password and click the **OK** button to access the web configuration tool.

Authentication Screen

Example 2: Manage the router's port forwarding rules from the Windows XP interface.

 **NOTE:** If you have already configured a port forwarding rule for the service through the web configuration tool, you don't need to perform the following steps for the same service again.

4. Right-click the **My Network Neighborhood** icon on the desktop.
5. Right-click the **Internet Connection** icon created for the router.

6. Right-click the icon and left-click **Properties**.
7. Click **Settings**.
8. Click **Add**.
9. Type Description of service, IP address of the service host, External Port number for this service, Internal Port number for this service, and click to

select either TCP or UDP. For example, the graph below shows an example of how to enable a computer with an IP address 192.168.2.101 to host a public HTTP server.

Service Settings

Service Settings

Description of service:
HTTP

Name or IP address (for example 192.168.0.12) of the computer hosting this service on your network:
192.168.2.101

External Port number for this service:
80

Internal Port number for this service:
80

☒ TCP ☐ UDP

OK Cancel

10. Click the **OK** button to save the changes.
