FCC ID N7NAC750
EA753377

Statement

The AC750 PCS wireless PCMCIA card can operate in both **voice and data mode**. The tests were done only in one mode since the RF performance and transmission is totally identical for both modes. The unit transmits in the assigned time slots independent if it is data or voice mode. (see also remarks in page 7 of the test report)

The test data are valid for both modes.

The antenna is removable. Only one antenna is used for this device. The antenna connector is a special custom designed connector for Sierra Wireless.

Tuning range

1850 – 1910 MHz for the uplink
1930 - 1990 MHz for the downlink

Maximum output power

The maximum output power in section 1.5 of the test report shows the wrong value. The measured power of the devices is documented in the relevant sections (EIRP and conducted power) of the test report.

Max peak power: 32.54 dBm + 1.8W
