

Portable Spread Spectrum transmitter for authorization under §15.247.

The transmitter operates in a single frequency band and it is not a module that operates as part of another product or device. The device does not operate in conjunction with another transmitter and its antenna is not co-located with other antennas.

The device and its antenna may operate at less than 2.5 cm from a person's body. The peak conducted with peak radiated (EIRP) output power are less than 25 mW. The device operates only in the 900 MHz band. Peak conducted output power is 7.9mW, and the antenna gain is 0 dBi. The antenna is directly attached to the device, no installation instructions are needed. The device is not a modular transmitter.

Given these considerations, no instructions to the user are needed in the manual.
